This paper is original research, no other authors previously published papers referred. The most important parameter in earthquake prediction is earthquake precursors that have been successfully identified. During generation process of earthquakes weather anomalies are generated as precursors, in this way the earthquake precursors are earthquakes related.

Based on atrocious weather anomalies and the corresponding devastating earthquakes can be verified even after 100 years. For the first time in the history of earthquake prediction, the satellite image of storm of East Pacific have been used to successfully predict earthquakes in California, the most significant in this observation study. As weather anomalies are generated by earthquake process, both individual and cluster of earthquakes are always preceded by weather anomalies, so, can be verified even after 100 years.

In this paper, the deadly and devastating earthquakes of M7.8 killed over 55,000 people and cause damage cost over 100 USD, though predicted in time but ignored and satellite image of storm to predict California earthquakes are tabulated. Experts can use this data catalogue to warn impending earthquakes to mitigate loss of lives and properties with more improvements.

Keywords: Orbital motion of the earth; Natural hazards, generation process of storms and earthquakes; driving force of tectonic plates, geological coordinates of precursors and earthquakes. satellite imagery of storms, East and West Pacific and North India

Introduction

Orbital motion of the earth causes Natural Hazards on earth every year at same locations. During the initial generation process of earthquakes, earthquake precursors are generated. All form of weather anomalies are the earthquake precursors, all are observable, recordable, scientifically tested and use for future reference to warn earthquakes at same location but with different severity level of earthquakes. The Earthquake generated earthquake precursors activities are above the earth surface phenomena and earthquakes activities are below the earth phenomena.

In the History of 2500 years earthquake studies, epicentre zone concept is the one and only successful earthquake prediction method. Earthquakes are occurred with the uniform earthquakes related precursors. Earthquakes and earthquake

generated precursors are testable and diagnosable on either way that is before and after devastating earthquakes. Even after hundreds of years of deadly earthquakes, the precursors for particular devastating earthquakes can be analysed and identified, say from earthquakes to weather precursors or from weather precursor to earthquakes. Most of the generation process of weather anomalies and followed by earthquakes are already discussed and published in previous five papers in Austin Journal of Publication. Every year, lakhs of tiny tremors are recorded all over the planet, so small that they go unnoticed. However, some huge earthquakes are remembered throughout history for being so massive destructive that they leave devastating consequences.

Figure 1: Turkey Map.

Figure 2: Heavy snowfall precursor for M7.8 devastating earthquake in Turkey.

Figure 3: After devastating earthquakes in Turkey.

Methodology

Detailed earthquake prediction method has been explained in the previous published papers as in the reference. The generation process of earthquakes confined to particular epicenter zones, so earthquakes are localised in nature. There are several

Feb.06, 2023
 Figure 4: The most devastating earthquakes of all time. Central Turkey (37-38N 38-39E)

misconceptions have been circulated in journals as journalistic interest, even for any massive earthquakes, the entire continent does not move.

One more interesting in earthquake prediction is, the satellite image of storms is also used to predict earthquakes at California regions in an innovative unique approach. This method also applicable to other regions too. In this satellite image, the bright image represents the storm location. See under the subtitle California. Earthquake prediction method: Time frame: usually 10-15 days after rainfall /snowfall; magnitude frame: 4-6; Rainfall (precursor) amount 50mm and above; location frame: up to 15° from precursor location and Direction: from precursor location to epicentre zone.

Result

Each and every earthquakes are preceded by uniform weather anomalies for the entire seismically active regions. Both precursor location and earthquakes occurred at corresponding locations are observed and tabulated.

Left column Precursor location and right column corresponding earthquake location. Star icons represent the snowfall/rainfall location and earthquakes location.

Figure 5: Europe and Middle East Asia.

Figure 6: Asia Map.

1 Timely warned based on heavy snowfall precursor but authorities ignored. Weather precursor for the devastating earthquakes in Turkey, heavy storms accompanied by rain, snow batter Istanbul.

Heavy snowfall, rain, storm and icing - that's what the Turkish weather authority has predicted for parts of the country. The governor calls on people to stay at home in Istanbul Heavy snowfall is to be expected in Anatolia and in the east of the country.

The people on the Black Sea would have to be prepared for heavy rain and some snowfall as well as storms. Winds could reach speeds of up to 75 km/h.

Heavy storms disrupted traffic and paralyzed daily life in many provinces of the region, especially in Istanbul. With cold waves coming from the Thrace region, snowfall gripped the higher parts of the Asian side of Istanbul. Turkish Airlines canceled a total of 238 flights, 72 of which were domestic and 166 of which were international flights at Istanbul Airport on Feb. 4 and 5 due to adverse weather conditions and expected snowfall. The bureau issued a "yellow alert" for heavy snowfall in Istanbul. A "yellow alert" is issued when there is a "potential threat by a weather event."

Feb.06, 2023

The Most Devastating Earthquakes of all Time

A 7.8-magnitude earthquake left thousands of people dead, with reports numbering over 55,000, and thousands more injured as it toppled buildings in southern Turkey and northern Syria in the early hours of February 6, 2023. More casualties were feared in the aftermath, which the US Geological Survey said included over a dozen aftershocks measuring 4.5 magnitude or more, per NBC.

The disastrous quake, which has trapped many people under rubble, was reportedly centered about 20 miles (32 km) from Gaziantep, Turkey, a major city and provincial capital when it struck at 3:17 am local time. Rescue efforts are underway as many fear the death toll may rise.

Feb.09, 2023

After Devastating Earthquakes in Turkey

Feb 07, 2023, Heavy snowfall in Turkey's Malatya hampered rescue and relief operations as the region turned into rubble after the massive earthquakes that hit the country on Monday. Survivors can be seen begging for help to pull out their children out of the rubble.

Latest on Quakes that Hit Beleaguered Region

A second 7.6-magnitude earthquake has hit southeastern Turkey. It followed a quake registering 7.8 that hit the region earlier on Monday. The early morning 7.8-magnitude temblor was centered about 20 miles from Gaziantep, a major city and provincial capital in Turkey. The first quake was Turkey's largest disaster since 1939.

Turkey's earthquakes have destroyed more than 5,000 homes and could affect more than 250,000 people: here are the estimates the Red Cross has made. Powerful earthquakes hit Turkey and parts of Syria on Monday, causing massive destruction of life and property. More than 6,000 people died in the quake, but the death toll is expected to rise.

Turkey and Syria were jolted by two major earthquakes of magnitude 7.8 and 7.5. Several aftershocks hampered the rescue work. The epicentre of Monday's earthquake was at a depth of about 17.9 kilometres near the Turkish city of Gaziantep. The city is home to around two million people.

Many people died because of freezing cold, living nightmare in my country: Turkish national on quake aftermath.

California Earthquakes

Storm Location and Earthquake Prediction for California Region

It is an innovative way to predict earthquakes with the help of Satellite images of storm location helpful to warn successfully the earthquakes in California, US and Hawaii.

Conclusion

Earthquake generated earthquake precursor identified is the most significant in this earthquake prediction study, all weather anomalies followed by earthquakes are observed and tabulated for the entire seismically active regions and based on this concept several earthquakes have been successfully predicted.

Orbital motion of the earth causes natural hazards like weather anomalies and earthquakes. Natural hazards are predictable but never preventable. The generation process of all form of weather anomalies are the part of the generation process of earthquakes. Weather anomalies are the earthquakes generated earthquake precursors.

Both weather and earthquake phenomena are naturally and scientifically interrelated. Even after hundred years, it is quite possible ascertain, one weather phenomena with corresponding earthquakes phenomena. Whether it may be based on weather to earthquakes and vice versa.

For instance, prior to December 06, 2004 ,Indian Ocean devastating earthquakes and tsunami; March 11, 2011 devastating earthquakes and tsunami in Japan and Feb.06,2023.the most devastating earthquakes of all time a 7.8-magnitude earthquake in Central Turkey, by severe atrocious record weather anomalies like, intense heat waves, forest fire, high category cyclone/typhoon and hurricanes, snowfalls, avalanches, ice breaks as examples of earthquake precursors occurred.

From the past record devastating earthquake details, can identify the precursor of the corresponding earthquakes. It is also observed that different Epicentre zones in same latitude, simultaneously activated seismically. Same location but different year (see in the sub-title Iceland), confirms orbital motion of the earth causes natural hazards on earth every year at same location and same duration.

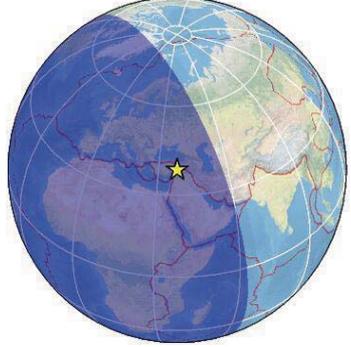

It is quite confirmed that earthquakes generated its own earthquake precursors, so for a particular weather anomalies at particular location it is possible to warn the impending earthquakes.this has been strongly proved in this paper. With observations of different regions of the world only with the earthquake generated earthquake precursors and successfully predicted several earthquakes but earth science experts and scientists ignored and neglected cause huge loss lives and properties.

Earthquake prediction research experts can use precursor and the corresponding earthquakes location data to mitigate loss of lives and properties.

The US west coast snowfall is once in a generation event.

The **unprecedented levels of snowfall on the west coast of the U.S. is a 'once-in-a-generation' event.** More than 40ft of snow has been received since the start of the season. From Oregon to the mountains of California, the towns are covered with a white sheet of snow. Portland, Oregon received nearly a foot of snow in a single day in what proved to be its second-snowiest day in history.

Joshimath land sinking: The holy town of Joshimath has been divided into three zones, 'Danger', 'Buffer', and 'Completely Safe', based on the magnitude of danger from land subsidence or the sinking or settling of the ground surface.

According to the bulletin, cracks have been noticed in a total of 678 buildings in the Joshimath town area. In view of security, a total of 81 families have been temporarily displaced.

"Under the Joshimath city area, 213 rooms have been temporarily identified as habitable, with their capacities estimated at 1191. Also, 491 rooms/halls have been identified in Pipalkoti outside the Joshimath area, with a combined capacity of 2,205," the bulletin said.

January 18, 2023

Dozens of people killed as cold wave sweeps Afghanistan

At least 70 people and 70,000 cattle have died within a week as many provinces witness a cold wave, with temperatures dipping to as low as -33C (-27F).

For the last two weeks, many provinces in Afghanistan have been witnessing exceptionally cold weather, with the central region of Ghor recording the lowest reading of -33C (-27F) over the weekend.

"This winter is by far the coldest in recent years," said Mohammad Nasim Muradi, the head of Afghanistan's meteorology office.

<p>Ranchi (Jharkhand) – A bridge on Kanchi river which was constructed just 3 years ago and built by spending Rs. 13 crore has collapsed in heavy rainfall due to Yaas cyclone. The bridge was 600 meters long and was connecting Tamar, Bundu and Sonahatu areas of Ranchi District. The bridge collapsed on 27th May in the afternoon.</p> <p style="text-align: center;">May.26,2023</p> <p>Jharkhand: Newly constructed bridge collapses near Ranchi allegedly due to illegal mining. In Jharkhand as a newly-constructed bridge collapsed just 70 kilometres away from the state capital of Ranchi. A pillar of the bridge crumbled allegedly due to years of illegal mining, while two other adjoining pillars are also unstable. Locals say that the bridge requires immediate repair, else the whole structure might collapse. The entire incident in Tamar area of Ranchi got triggered after cyclonic winds and subsequent rainfall due to Cyclone Yaas rattled the weak structure.</p>	<p style="text-align: center;">Jun.06,2023 Western Xizang M4.0/ 34.37 N; 82.16 E Jun.12,2023 Western Xizang M4.5/ 33.20 N; 86.95 E</p>

A Bihar Bridge Collapse: Construction Company Faces Blacklist Threat
 bridge that was being constructed in Bihar's Bhagalpur district turned into a pile of rubble on Sunday. It is the second time in 14 months that the four-lane road bridge worth Rs 1,710 crore collapsed. Now, Chief Minister Nitish Kumar-led Bihar government has taken strict action against the construction company - SP Singla Constructions.
 On Monday, a notice was sent to the construction company responsible for the building of the bridge and also suspended an executive engineer of the Road Construction Department.

Selvan- Lalitha Selvan, S. Haran, S. Senthilkumar- Vasuki, Elango – Vijaya Lakshmi, M. Karthikeyan, Aruna Shankari, Vimala Shankari, V. Badri-Latha, M. Balaji- Mahalakshmi, M. Prema Latha M. Sekar - Mahalakshmi, Babu- Sasikala Devi, Raja- Akilamani, Sentil- Kamala, Valliammai Murugeswaran, Sivakumar-Uma, Mu. Priya, Selvarani Dharmarajan, Dr. Raman- Govindammal; R. Adikala Devi, Dr. Shanmuga Priya, William, Sivagnanam- Yogarani, C. Sakthivel, R. Ramesh, S. Surya Prakash, V. Ravichandran, RLY, V. Sekar, D. Shanmugam, N. Ranjith, R. Gowtham, M. Elango - Shanthi, Thiyagarajan, TV Koil, S. Ramanujan and Subba Rao, Marudhai- Pushpam for their support and wishes to my continuous hectic efforts since year 1985.

I would like to show my whole-hearted gratitude to Dr. V. Shantha, Chairman, Adyar, Cancer Institute, Chennai. Dr. Venkatraman Radhakrishnan, Department of Medical Oncology, Dr. Aravind Krishnamurthy, Department of Surgical Oncology, and B. Gopinath, Adyar Cancer Institute (WIA), Chennai, India where I am taking the best medical treatment and helping me to get second lease of life to serve this humanity.

I also immensely grateful to Dr. Michael Blanpied, NEPEC Secretary, USGS and Dr. Jermy Zechar, CSEP, USA for sharing their pearls of wisdom during the course of this observational research and Dr. Zechar arranged his students to test my hypothesis and Prof. Dr. E.C.G. Sudharsan, Department of Particle Physics, Austin University, USA. Also my sincere thanks to Prof. Dr. R. Chandramohan, Research Advisor, Vidhyaa Giri College

of Arts and Science, Puduvayal, Tamilnadu, India and Prof. Dr. A.T. Ravichandran, Department of Physics, National College, Tiruchi, Tamilnadu, India, Dr. Anand, Department of Physics, Bishop Heber college, Tiruchi, Prof. Dr. Viravazhudhi, TN, India, Dr. N. Venkatanathan, SASTRA University, Dr. S. Sharmila, P. Moorthi, Profs. J.S.P. Ebenezer, V.A. Chinnappan, for valuable suggestions in this observation research study.

I could not do this historic landmark achievement beneficial to the entire humanity without the support data source of the websites:
