

## Polymorphs of gabapentin

Hayley A. Reece and Demetrius C. Levendis

DSCs of the  $\alpha$ -  $\beta$ - and  $\gamma$ - polymorphs of gabapentin. Phase transitions of the  $\beta$  and  $\gamma$  polymorphs have been identified at around 87-89°C. Additional phase transitions may occur near the melting points of each form. Further investigations of these phase transitions are currently being undertaken (Levendis & Reece, 2007).
