## Preface

This work discusses the structure, symbols, and properties of magnetic space groups. While the focus is on three-dimensional magnetic space groups, we have included analogous information on the structure, symbols, and properties of one- and two-dimensional magnetic space groups.

Unlike Gaul, this work is divided into two parts. The first is a discussion of the structure of magnetic groups, the Opechowski and Guccione symbols for magnetic space groups and the explicit listing of elements of one representative group from each of the 7, 80, and 1651 types of groups in, respectively, the superfamilies of one- two- and three-dimensional magnetic space groups. The second part of this work is an extension of the classic work on space groups published in the *International Tables for Crystallography, Volume A: Space-Group Symmetry*, my work on non-magnetic subperiodic groups published in the *International Tables for Crystallography, Volume E: Subperiodic Groups*, and my work on international-like tables for magnetic subperiodic groups. A reader familiar with any of these tables should readily recognize most content and format of the magnetic space group tables presented here.

This book was not computer generated. It was hand-calculated, checked, and typed. Consequently, in a massive work as this, the probability of errors and/or typos is then not zero. The author would appreciate being informed of any errors and/or typos found.

# 1. Magnetic Space Groups: Symbols and Elements

## 1.1 Introduction

Magnetic groups are symmetry groups of arrangements of non-zero magnetic moments (spins). These groups were introduced by Landau and Lifschitz (1951, 1957) by reinterpreting the operation of "change in color" in two-color (black and white) crystallographic groups as "time inversion." Crystallographic two-color groups of rotations had been given by Heesch (1930) and Shubnikov (1951). The 1651 types of two-color three-dimensional space groups were derived by Belov et al (1955, 1957) and by Zamorzaev (1953, 1957) and called *Shubnikov groups*. Koptsik (1966) applied these groups to determine crystallographic and physical properties of magnetic structures.

The three-dimensional magnetic space groups were rederived and a new list of symbols for 1191 types of magnetic space groups was given by Opechowski & Guccione (1965) (see also Opechowski, 1986; Litvin, 2001, and Section 1.3). This number plus 230 space group types gives 1421 types of magnetic groups. The 230 types of groups which are the direct product of a space group and the time inversion group are not magnetic groups as the time inversion element in each such group precludes non-zero magnetic moments. To include these groups, Opechowski (1986) used the concept of *reduced magnetic superfamily* of a space group (see Section 1.2) to give a total of 1651 types of groups commonly referred to as *magnetic space groups*.

The Opechowski & Guccione list consists of a listing of a symbol for one representative magnetic space group from each type. To uniquely specify the meaning of these symbols required a specification of one representative space group chosen

from each of the 230 types of space groups. This specification was made in conjunction with Volume I of the *International Tables for X-ray Crystallography* (1952) (abbreviated here as *ITC52*). In particular, this specification of one space group from each type was based on the specific form of the coordinate triplets of the set of general positions explicitly printed in *ITC52*.

*ITC52* has been replaced by Volume A of the *International Tables for Crystallography* (1983) (abbreviated here as *ITC-A*). One finds that, for some space groups, the set of coordinate triplets of the general positions explicitly printed in *ITC-A* differs from that explicitly printed in *ITC52*. As a consequence, if one attempts to interpret the Opechowski-Guccione symbols using *ITC-A*, one will, in many cases misinterpret the meaning of the symbol (Litvin, 1997, 1998)<sup>1</sup>.

Using the Opechowski-Guccione symbols, a list of symbols of the 1651 superfamilies of magnetic space group types is given in Table 1.1. In distinction from previous listings, where only a set of symbols were given, we specify explicitly the meaning of each symbol (Litvin, 2001). That is, we specify a representative magnetic group of that type. This consists of specifying the coordinate system used, and then relative to that coordinate system, the translational subgroup of the group. We then explicitly give a set of coset representatives of the coset decomposition of the group

---

<sup>1</sup> It was suggested in these two papers that the original Opechowski-Guccione set of symbols should be modified so one could correctly interpret them using *ITC-A* instead of *ITC52*. Adopting this ill-advised suggestion would have required in the future a new modification of the Opechowski-Guccione set of symbols whenever changes were made to the coordinate triplets of the general positions in *ITC-A*. Consequently, the meaning of the original Opechowski-Guccione list of symbols was specified by Litvin (2001).

with respect to its translational subgroup.

In Section 1.2, the concept of *reduced magnetic superfamily* of a space group is reviewed. This concept provides for a sub-classification of magnetic space groups. This is followed, in Section 1.3, by a detailed explanation of the contents of Table 1.1., of the magnetic space group type symbols and elements. In Section 1.4 we list the changes in the symbols listed in Opechowski & Guccione (1965) and Opechowski (1986), and those of Table 1.1 . A comparison of the symbols introduced by Opechowski & Guccione (1965) and those of Belov et al (1957) is discussed in Section 1.5 . A side by side comparison is given in Table 1.4.

For one- and two-dimensional black and white space groups, see respectively, Neronova & Belov (1961) and Weber (1929), Heesch (1929), Cochran (1952) and Belov & Tarkhova (1956). The symbols used here for the superfamilies of one- and two-dimensional magnetic space group types are given in Table 1.1 along with a specification of a representative group of each type. A comparison of the symbols for these groups with that of black and white group symbols given by Niggli (1964) and Belov & Tarkhova (1956) are given in Table 1.2 .

## 1.2 Magnetic Superfamily

Let  $\mathbf{F}$  denote a space group type. The *reduced magnetic superfamily* of the space group of type  $\mathbf{F}$  (Opechowski, 1986) consists of <sup>2</sup>

- 1) A group of type  $\mathbf{F}$ .
- 2) The group  $\mathbf{F1}'$ , where  $\mathbf{1}'$  denotes time inversion group consisting of the identity  $1$  and time inversion  $1'$ .
- 3) All non-equivalent groups  $\mathbf{F(D)} = \mathbf{D} + (\mathbf{F} - \mathbf{D})\mathbf{1}'$  where  $\mathbf{D}$  is a subgroup of index two of  $\mathbf{F}$ . Groups of this type will also be denoted by  $\mathbf{M}$ .

The third set of groups is divided into two subdivisions:

- 3a) Groups  $\mathbf{M}_T$ , where  $\mathbf{D}$  is an equi-translational subgroup of  $\mathbf{F}$ .
- 3b) Groups  $\mathbf{M}_R$ , where  $\mathbf{D}$  is an equi-class subgroups of  $\mathbf{F}$ .

A survey of the crystallographic groups of the magnetic superfamily of crystallographic groups of type  $\mathbf{F}$  will consist of a listing of a set of coset representatives called the *standard set of coset representatives*, of the decomposition of the group with respect to its translational subgroup, of one group, called the *representative group*, from the groups of type  $\mathbf{F}$ , one group  $\mathbf{F1}'$ , and each non-equivalent group  $\mathbf{F(D)}$ <sup>3</sup>. The symbol for each listed group is used to denote both the group and the group's type. Reference to *the group*  $\mathbf{F}$ ,  $\mathbf{F1}'$ , or  $\mathbf{F(D)}$  will refer to

---

<sup>2</sup> A *magnetic superfamily* as defined by Zamorzaev (1957) does not include groups of type  $\mathbf{F}$ .

<sup>3</sup> Only the relative lengths and mutual orientations of the translation vectors and the standard set of coset representatives with respect to an implied coordinate system are given. The absolute lengths of translation vectors, the position in space of the origin of the coordinate system and the orientation in that space of the basis vectors of the coordinate system are not explicitly given.

the listed group and to *the group type* **F**, **F1'**, or **F(D)** to that group's type.

### 1.3 Tables of Magnetic Space Group Symbols and Elements

The format of Table 1.1 is :

- 1) Serial number of the magnetic space group type.
- 2) Symbol of the magnetic space group type.
- 3) Symbol of the group type of the subgroup **D** of index two of **F** for magnetic space groups **F(D)**, and the position and orientation of the group **D** in the coordinate system of the group **F(D)** [ which is the same as the coordinate system of **F** ].
- 4) The standard set of coset representatives of the decomposition of the magnetic space group with respect to its translational subgroup.

#### 1.3.1 Serial Number

A three part number  $N_1.N_2.N_3$  is used.  $N_1$  is a sequential number for the group type to which **F** belongs. This is the same numbering as given in both *ITC52* and *ITC-A* for the two and three-dimensional space group types.  $N_2$  is a sequential numbering of the magnetic space group types of the superfamily of **F**. Group types **F** always have the assigned number  $N_1.1.N_3$ , and group types **F1'** the assigned number  $N_1.2.N_3$ .  $N_3$  is a global sequential numbering of the 7, 80, and 1651 types of groups in, respectively, the superfamilies of one- two- and three-dimensional magnetic space groups.

#### 1.3.2 Magnetic Space Group Symbol

In Figures 1.1 we give a list of symbols and diagrams for the magnetic group lattices.

The relative lengths and mutual orientations of the translation vectors of the translational subgroups of magnetic space groups are the same as for space groups  $\mathbf{F}$ . These lattice parameters are given in Table 1.2 according to the crystal system of  $\mathbf{F}$ . In Table 1.3.1 we give the symmetry directions of symmetry operations represented by characters in the Hermann-Mauguin symbol of a magnetic space group implied by the characters position in the symbol. In Table 1.3.2 we give the symbols used as subindices on the symmetry operations which represent these symmetry directions.

The symbol for a group  $\mathbf{F}$  is that symbol for the group type  $\mathbf{F}$  given by Opechowski and Guccione (1965). This group  $\mathbf{F}$  is uniquely defined by its translational subgroup and the coset representatives of the coset decomposition of the group with respect to its translational subgroup. These coset representatives, see Section 1.3.4 below, are given in Table 1.1. The symbol for a group  $\mathbf{F1'}$  is that of the group type  $\mathbf{F}$  followed by  $\mathbf{1'}$ .

The symbol for a group  $\mathbf{M}_T = \mathbf{F}(\mathbf{D}) = \mathbf{D} + (\mathbf{F} - \mathbf{D})\mathbf{1'}$  is based on the symbol for the group  $\mathbf{F}$ . As  $\mathbf{D}$  is an equi-translational subgroup of  $\mathbf{F}$ , i.e. the translational subgroup  $\mathbf{T}^{\mathbf{M}_T}$  of the magnetic group  $\mathbf{M}_T$  is  $\mathbf{T}$ , the translational subgroup of  $\mathbf{F}$ . The translational part of the group symbol of a  $\mathbf{M}_T$  group is then the same as that of the corresponding group  $\mathbf{F}$ . A number or letter in the rotational part of the symbol of  $\mathbf{F}$  appears unchanged in the symbol for  $\mathbf{M}_T$  if it is associated with a coset representative of the group  $\mathbf{F}$ , in the coset decomposition of  $\mathbf{F}$  with respect to  $\mathbf{T}$ , which is also an element contained in the subgroup  $\mathbf{D}$ . If not in  $\mathbf{D}$ , i.e. in  $\mathbf{F} - \mathbf{D}$ , the number or letter appears in the symbol for  $\mathbf{M}_T$  with a prime to denote that the element in  $\mathbf{M}_T$  is coupled with  $\mathbf{1'}$ . For example, the

orthorhombic space group  $\mathbf{F} = \mathbf{Pca2}_1$  is listed as the three-dimensional magnetic space group number 29.1.198. This group is defined by a orthorhombic translational subgroup  $\mathbf{T} = \mathbf{P}$ , see Figures 1.1-3D, and the standard set of coset representatives<sup>4</sup>

$$(1|000) \quad (m_x|\frac{1}{2},0,\frac{1}{2}) \quad (m_y|\frac{1}{2},0,0) \quad (2_z|0,0,\frac{1}{2}),$$

the coset decomposition of  $\mathbf{F}$  with respect to  $\mathbf{T}$  can then be written as:

$$\mathbf{F} = \mathbf{T} + (m_x|\frac{1}{2},0,\frac{1}{2})\mathbf{T} + (m_y|\frac{1}{2},0,0)\mathbf{T} + (2_z|0,0,\frac{1}{2})\mathbf{T}.$$

The magnetic space group 29.5.202 is a group  $\mathbf{M}_T$  whose symbol is  $\mathbf{Pc}'\mathbf{a}'\mathbf{2}_1$ . In this case we have

$$\mathbf{Pc}'\mathbf{a}'\mathbf{2}_1 = \mathbf{P2}_1 + (\mathbf{Pca2}_1 - \mathbf{P2}_1)1'$$

i.e.  $\mathbf{F} = \mathbf{Pca2}_1$  and  $\mathbf{D} = \mathbf{P2}_1$ . The symbol "2<sub>1</sub>" in the symbol for  $\mathbf{F} = \mathbf{Pca2}_1$  refers to the coset representative  $(2_z|0,0,\frac{1}{2})$ , an element in  $\mathbf{D} = \mathbf{P2}_1$ . Consequently the symbol appears unprimed in the symbol for  $\mathbf{M}_T$  ( $\mathbf{Pc}'\mathbf{a}'\mathbf{2}_1$ ) and the coset representative  $(2_z|0,0,\frac{1}{2})$  appears as an unprimed coset representative in the standard set of coset representatives of  $\mathbf{M}_T$ . The symbols "c" and "a" in  $\mathbf{F} = \mathbf{Pca2}_1$  refer to the coset representatives  $(m_x|\frac{1}{2},0,\frac{1}{2})$  and  $(m_y|\frac{1}{2},0,0)$ , respectively, neither of which are contained in  $\mathbf{D}$ . Consequently both symbols appear primed in the symbol for  $\mathbf{M}_T$  ( $\mathbf{Pc}'\mathbf{a}'\mathbf{2}_1$ ) and the coset representatives  $(m_x|\frac{1}{2},0,\frac{1}{2})$  and  $(m_y|\frac{1}{2},0,0)$  appear as primed coset representatives in the standard set of coset representatives of  $\mathbf{M}_T$ . The magnetic group  $\mathbf{Pc}'\mathbf{a}'\mathbf{2}_1$  then has the orthorhombic translational subgroup  $\mathbf{T} = \mathbf{P}$  and the standard set of coset representatives

---

<sup>4</sup>We use the Seitz notation  $(R|\tau(R) + t)$  for elements of a space group  $\mathbf{F}$ . "R" is a rotation or rotation-inversion, "t" is a translation of the translational subgroup  $\mathbf{T}$  of  $\mathbf{F}$ , and " $\tau(R)$ " is a non-primitive translation associated with "R". The coset representatives are taken to be of the form  $(R|\tau(R))$  which then defines the  $\tau(R)$  associated with the R.

$$(1|000) \quad (m_x|\frac{1}{2},0,\frac{1}{2})' \quad (m_y|\frac{1}{2},0,0)' \quad (2_z|0,0,\frac{1}{2}).$$

The symbol for a group  $\mathbf{M}_R = \mathbf{F}(\mathbf{D}) = \mathbf{D} + (\mathbf{F} - \mathbf{D})1'$  is also based on the symbol for the group  $\mathbf{F}$ . (This is in contradistinction to the “BNS” symbols of  $\mathbf{M}_R$  groups (Belov, Neronova, & Smirnova (1955, 1957)) where the symbol for a  $\mathbf{M}_R$  group is based on the symbol for the group  $\mathbf{D}$ , see below Section 1.5) As this is an equi-class magnetic group, half the translations of  $\mathbf{F}$  are now coupled with  $1'$  in  $\mathbf{M}_R$  and half the translations remain unprimed in  $\mathbf{M}_R$ . The unprimed translations constitute the translational subgroup  $\mathbf{T}^D$  of  $\mathbf{D}$ . We can write the coset decomposition of the translational subgroup  $\mathbf{T}$  of  $\mathbf{F}$  with respect to the translational subgroup  $\mathbf{T}^D$  of  $\mathbf{D}$  as

$$\mathbf{T} = \mathbf{T}^D + \mathbf{t}_\alpha \mathbf{T}^D$$

where  $\mathbf{t}_\alpha$  is a translation of  $\mathbf{F}$  which appears primed (coupled with  $1'$ ) in  $\mathbf{M}_R$ . The translational subgroup of  $\mathbf{M}_R$  can then be written as

$$\mathbf{T}^M_R = \mathbf{T}^D + \mathbf{t}'_\alpha \mathbf{T}^D$$

Symbols for the translational groups  $\mathbf{T}$ , the translational subgroups  $\mathbf{T}^D$  of  $\mathbf{T}$  used in the symbol for  $\mathbf{M}_R$  groups, and the choice of the translations  $\mathbf{t}_\alpha$  for magnetic space groups is given in Figures 1.1 .

The symbol for a magnetic group  $\mathbf{M}_R = \mathbf{F}(\mathbf{D})$  is based on the symbol of the group  $\mathbf{F}$ , and is also a symbol for the subgroup  $\mathbf{D}$  of unprimed elements. The translational part of the symbol of  $\mathbf{F}$  is replaced by the symbol for the translational subgroup  $\mathbf{T}^D$  of  $\mathbf{D}$ . If a coset representative  $(R|\tau(R))$  of  $\mathbf{T}$  in  $\mathbf{F}$  appears as the coset representative  $(R|\tau(R)+\mathbf{t}_\alpha)$  of  $\mathbf{T}^D$  in  $\mathbf{D}$ , then the number or letter corresponding to  $(R|\tau(R))$  in the symbol for  $\mathbf{F}$  is primed. If  $(R|\tau(R))$  appears unchanged as a coset representative of  $\mathbf{T}^D$  in  $\mathbf{D}$ ,

then the number or letter corresponding to  $(R|\tau(R))$  in the symbol for  $\mathbf{F}$  is unchanged.

The resulting symbol is a symbol for  $\mathbf{D}$  based on the symbol for  $\mathbf{F}$  and is also a symbol for the magnetic space group  $\mathbf{M}_R = \mathbf{F}(\mathbf{D})$ . The symbol specifies not only  $\mathbf{D}$  but also  $\mathbf{F}$ : By deleting the subindex on the translational part of the symbol and the primes on the rotational part one obtains the symbol specifying  $\mathbf{F}$ . Having specified  $\mathbf{D}$  and  $\mathbf{F}$  one has specified the group  $\mathbf{M}_R = \mathbf{F}(\mathbf{D})$ . For example: Consider again the three-dimensional space group 29.1.198,  $\mathbf{F} = \mathbf{Pca}2_1$  where

$$\mathbf{F} = \mathbf{T} + (m_x|\frac{1}{2},0,\frac{1}{2})\mathbf{T} + (m_y|\frac{1}{2},0,0)\mathbf{T} + (2_z|0,0,\frac{1}{2})\mathbf{T} .$$

The symbol for the  $\mathbf{M}_R = \mathbf{F}(\mathbf{D})$  group 29.7.204 is  $\mathbf{P}_{2b}\mathbf{c}'\mathbf{a}'2_1$  and is based on the symbol for  $\mathbf{F}$ . The translational subgroup  $\mathbf{T}^D$  of  $\mathbf{D}$  is given by the symbol  $\mathbf{P}_{2b}$  where  $\mathbf{t}_a = \mathbf{b} = (0,1,0)$ . The two primed symbols  $\mathbf{c}'$  and  $\mathbf{a}'$  in  $\mathbf{P}_{2b}\mathbf{c}'\mathbf{a}'2_1$  denote that the two coset representatives  $(m_x|\frac{1}{2},0,\frac{1}{2})$  and  $(m_y|\frac{1}{2},0,0)$  that appear in the set of standard coset representatives of  $\mathbf{T}$  in  $\mathbf{F}$  appear as the coset representatives  $(m_x|\frac{1}{2},1,\frac{1}{2})$  and  $(m_y|\frac{1}{2},1,0)$  in the set of standard coset representatives of  $\mathbf{T}^D$  in  $\mathbf{D}$ . As the symbol  $2_1$  in  $\mathbf{P}_{2b}\mathbf{c}'\mathbf{a}'2_1$  is not primed, the coset representative  $(2_z|0,0,\frac{1}{2})$  of  $\mathbf{T}$  in  $\mathbf{F}$  remains unchanged as a coset representative of  $\mathbf{T}^D$  in  $\mathbf{D}$ . We have then the subgroup:

$$\mathbf{D} = \mathbf{T}^D + (m_x|\frac{1}{2},1,\frac{1}{2})\mathbf{T}^D + (m_y|\frac{1}{2},1,0)\mathbf{T}^D + (2_z|0,0,\frac{1}{2})\mathbf{T}^D$$

We note that these same coset representatives of  $\mathbf{T}^D$  in  $\mathbf{D}$  are also the coset representatives of the standard set of coset representatives of  $\mathbf{T}^M_R$  in  $\mathbf{M}_R$

$$\mathbf{M}_R = \mathbf{T}^M_R + (m_x|\frac{1}{2},1,\frac{1}{2})\mathbf{T}^M_R + (m_y|\frac{1}{2},1,0)\mathbf{T}^M_R + (2_z|0,0,\frac{1}{2})\mathbf{T}^M_R$$

and consequently the standard set of coset representatives of  $\mathbf{P}_{2b}\mathbf{c}'\mathbf{a}'2_1$  listed in the tables is:

$$(1|0,0,0) \quad (m_x|\frac{1}{2},1,\frac{1}{2}) \quad (m_y|\frac{1}{2},1,0) \quad (2_z|0,0,\frac{1}{2})$$

Also, since  $\mathbf{T}_R^M = \mathbf{T}^D + \mathbf{t}_\alpha' \mathbf{T}^D$  it follows that:

$$\mathbf{M}_R = \mathbf{D} + (\mathbf{F}-\mathbf{D})1'$$

$$\begin{aligned} \mathbf{M}_R = & (1|0,0,0) \mathbf{T}^D + (m_x|\frac{1}{2},1,\frac{1}{2}) \mathbf{T}^D + (m_y|\frac{1}{2},1,0) \mathbf{T}^D + (2_z|0,0,\frac{1}{2}) \mathbf{T}^D + \\ & + (1|0,1,0)' \mathbf{T}^D + (m_x|\frac{1}{2},0,\frac{1}{2})' \mathbf{T}^D + (m_y|\frac{1}{2},0,0)' \mathbf{T}^D + (2_z|0,1,\frac{1}{2})' \mathbf{T}^D \end{aligned}$$

Consequently, a primed number or letter in the symbol for  $\mathbf{M}_R$  (which is a symbol for  $\mathbf{D}$ ) denotes that the corresponding coset representative appears in  $\mathbf{D}$  coupled with  $\mathbf{t}_\alpha$  and primed in  $(\mathbf{F}-\mathbf{D})1'$ , e.g.  $\mathbf{a}'$  in  $\mathbf{P}_{2b}\mathbf{c}'\mathbf{a}'\mathbf{2}_1$  denotes that the coset  $(m_x|\frac{1}{2},0,\frac{1}{2})$  appears as  $(m_x|\frac{1}{2},1,\frac{1}{2})$  in  $\mathbf{D}$  and as  $(m_x|\frac{1}{2},0,\frac{1}{2})'$  in  $(\mathbf{F}-\mathbf{D})1'$ . An unprimed number or letter in the symbol for  $\mathbf{M}_R$  (which is a symbol for  $\mathbf{D}$ ) denotes that the corresponding element appears unchanged in  $\mathbf{D}$  and coupled with  $\mathbf{t}_\alpha$  and primed in  $(\mathbf{F}-\mathbf{D})1'$ , e.g. the symbol  $\mathbf{2}_1$  in  $\mathbf{P}_{2b}\mathbf{c}'\mathbf{a}'\mathbf{2}_1$  denotes that  $(2_z|0,0,\frac{1}{2})$  is in  $\mathbf{D}$  and  $(2_z|1,0,\frac{1}{2})'$  in  $(\mathbf{F}-\mathbf{D})1'$ .

### 1.3.3 Symbol of the subgroup $\mathbf{D}$

The third column contains the group type symbol of the subgroup  $\mathbf{D}$  of index two of the magnetic group  $\mathbf{M} = \mathbf{F}(\mathbf{D})$ .

a) For  $\mathbf{M}_T$  groups, the subgroup  $\mathbf{D}$  is defined by the translational subgroup  $\mathbf{T}$  of  $\mathbf{F}$  and the unprimed coset representatives listed in the fourth column.

b) For  $\mathbf{M}_R$  groups,  $\mathbf{D}$  is defined by the translational subgroup  $\mathbf{T}^D$  and the set of all coset representatives listed in the fourth column.

While the group type symbol of  $\mathbf{D}$  is given, the coset representatives of the subgroup  $\mathbf{D}$  of  $\mathbf{M}_T$  or  $\mathbf{M}_R$  defined in a) or b), respectively, may not be identical with the

standard set of coset representatives of the group **D** found in the listing of the magnetic space groups. Consequently, to show the relationship between this group **D** and the group of type **D** listed in the tables, additional information is provided to define a new coordinate system in which the coset representatives of this subgroup of type **D** are identical with the standard set of coset representatives listed for the group **D**.

Let  $(\mathbf{O}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  be the coordinate system in which the three-dimensional space group **F** is defined. “**O**” is the origin of the coordinate system, and **a**, **b**, and **c** are the basis vectors of the coordinate system. **a**, **b**, and **c** represent a set of basis vectors for a primitive cell for primitive lattices and for a conventional cell for centered lattices. A second coordinate system is defined by  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$ . The origin is first translated from **O** to  $\mathbf{O}+\mathbf{t}$ , and then the basis vectors **a**, **b**, and **c** are changed to **a'**, **b'** and **c'** (for details, see Appendix 1.1).

Immediately following the group type symbol for the subgroup **D** of **F** we give a coordinate system  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$  [In the tables, for typographical simplicity, the symbols “**O**+” are omitted.] in which the coset representatives of the subgroup **D** of **F** are identical with the standard set of coset representatives of the group **D** found in the listing of the magnetic space groups. **t**, **a'**, **b'**, and **c'** are given in terms of the basis vectors of the coordinate system  $(\mathbf{O}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  of the group **F**.

Example 1: For the  $\mathbf{M}_T$  magnetic group 10.4.52 = P2/m' one finds in the tables:

P2     $(0,0,0; \mathbf{a}, \mathbf{b}, \mathbf{c})$      $(1|0,0,0)$      $(2_y|0,0,0)$      $(\bar{1}|0,0,0)'$      $(m_y|0,0,0)'$

The translational subgroup of **D** is generated by the translations  $(1|1,0,0)$ ,  $(1|0,1,0)$ , and  $(1|0,0,1)$  of **T** since this is a  $\mathbf{M}_T$  magnetic group, and the coset representatives of this group are  $(1|0,0,0)$  and  $(2_y|0,0,0)$ , the unprimed coset representatives on the right. This subgroup **D** is of type P2. In the tables, listed for the group 3.1.8 P2, one finds the identical two coset representatives. Consequently, there is no change the coordinate system, i.e.  $\mathbf{t}=(0,0,0)$  and  $\mathbf{a}'=\mathbf{a}$ ,  $\mathbf{b}'=\mathbf{b}$ , and  $\mathbf{c}'=\mathbf{c}$ . In the coordinate system of the magnetic group P2/m', the coset representatives of its subgroup **D**, of the type P2, are identical with the coset representatives of the group P2 found in the tables.

Example 2: For the  $\mathbf{M}_R$  three-dimensional magnetic space group 16.7.105  $P_{2c}22'2'$  one finds in the tables:

$$P222_1 \quad (0,0,0;\mathbf{a},\mathbf{b},2\mathbf{c}) \quad (1|0,0,0) \quad (2_x|0,0,0) \quad (2_y|0,0,1) \quad (2_z|0,0,1)$$

The translational subgroup of **D** is generated by the translations  $(1|1,0,0)$ ,  $(1|0,1,0)$ , and  $(1|0,0,2)$ , the generators of the unprimed subgroup of  $\mathbf{T}^{\mathbf{M}}_R$ , and the coset representatives of this group are all those coset representatives on the right. This subgroup **D** is of type P222<sub>1</sub>. In the tables, listed for the group 17.1.106 P222<sub>1</sub> one finds a different set of coset representatives:

$$(1|0,0,0) \quad (2_x|0,0,0) \quad (2_y|0,0,\frac{1}{2}) \quad (2_z|0,0,\frac{1}{2})$$

Consequently, to show the relationship between the subgroup **D** of type P222<sub>1</sub> and the

listed group  $P222_1$ , we change the coordinate system in which  $\mathbf{D}$  is defined to  $(0,0,0;\mathbf{a},\mathbf{b},2\mathbf{c})$ . In this new coordinate system the coset representatives of  $\mathbf{D}$  are identical with the coset representatives of the representative group  $P222_1$ .

Example 3: For the  $\mathbf{M}_T$  magnetic group 18.4.116  $P2_12_1'2'$  one finds in the tables:

$$P2_1(0, \frac{1}{4}, 0; \mathbf{c}, \mathbf{a}, \mathbf{b}) \quad (1|000) \quad (2_x|\frac{1}{2}, \frac{1}{2}, 0) \quad (2_y|\frac{1}{2}, \frac{1}{2}, 0)' \quad (2_z|000)'$$

The translational subgroup of  $\mathbf{D}$  is generated by the translations  $(1|0,0,1)$ ,  $(1|1,0,0)$ , and  $(1|0,1,0)$ , and the coset representatives of this group are  $(1|000)$  and  $(2_x|\frac{1}{2}, \frac{1}{2}, 0)$ , the unprimed coset representatives on the right. The group  $\mathbf{D}$  is of type  $P2_1$ . In the tables, for the group 4.1.15  $P2_1$  one finds a different set of coset representatives,  $(1|0,0,0)$  and  $(2_y|0, \frac{1}{2}, 0)$ . Consequently, to show the relationship between the subgroup  $\mathbf{D}$  of type  $P2_1$  and the listed group  $P2_1$ , we change the coordinate system in which the subgroup  $\mathbf{D}$  is defined to  $(0, \frac{1}{4}, 0; \mathbf{c}, \mathbf{a}, \mathbf{b})$ . The origin is first translated from  $\mathbf{O}$  to  $\mathbf{O}+\mathbf{t}$ , where  $\mathbf{t}=(0, \frac{1}{4}, 0)$  and the a new set of basis vectors,  $\mathbf{a}'=\mathbf{c}$ ,  $\mathbf{b}'=\mathbf{a}$ , and  $\mathbf{c}'=\mathbf{b}$  is defined. In this new coordinate system the coset representatives of the subgroup  $\mathbf{D}$  are identical with the standard set of coset representatives of the representative group  $P2_1$ .

### 1.3.4 Coset Representatives

The groups listed are defined by their translational subgroups and a set of coset representatives, the standard set, of the coset decomposition of each group with

respect to its respective translational subgroup. The defining coset representatives are listed on the right hand side of Tables 1.1 .

A two- or three-dimensional space group  $\mathbf{F}$  is defined by its translational subgroup and the set of coset representatives implied by the coordinates of the set of equivalent positions explicitly listed *ITC52*. For example, The three-dimensional space group  $\mathbf{F} = \text{P}222_1$  (17.1.106) has a primitive translational subgroup generated by  $(1|1,0,0)$ ,  $(1|0,1,0)$ , and  $(1|0,0,1)$ . The coordinates of the set of equivalent positions listed in *ITC52* under the group type  $\text{P}222_1$  are:

$$x,y,z; \quad x,\bar{y},\bar{z}; \quad \bar{x}, y, \frac{1}{2}+\bar{z}; \quad \bar{x},\bar{y}, \frac{1}{2}+z$$

The coset representative  $(R|\tau(R))$  corresponding to a specific equivalent position  $\mathbf{r}' = x',y',z'$  is given by the equation  $\mathbf{r}' = (R|\tau(R))\mathbf{r} = R\mathbf{r} + \tau(R)$ . Corresponding to the preceding equivalent positions are the coset representatives

$$(1|0,0,0); \quad (2_x|0,0,0); \quad (2_y|0,0,\frac{1}{2}); \quad (2_z|0,0,\frac{1}{2}),$$

which are listed in Table 1.1.

The coset representatives of groups  $\mathbf{F1}'$  are not explicitly given. These are taken as the coset representatives of  $\mathbf{F}$  plus each of these coset representatives multiplied by  $1'$ . For example, the coset representatives of  $\mathbf{F} = \text{P}222_1$  are given above. The coset representatives of  $\mathbf{F1}' = \text{P}222_11'$  are

$$(1|0,0,0); \quad (2_x|0,0,0); \quad (2_y|0,0,1/2); \quad (2_z|0,0,1/2),$$

$$(1|0,0,0)'; \quad (2_x|0,0,0)'; \quad (2_y|0,0,1/2)'; \quad (2_z|0,0,1/2)'.$$

The coset representatives of groups  $\mathbf{M}_T = \mathbf{F}(\mathbf{D})$  are derived from the coset representatives of  $\mathbf{F}$ . Each coset representative of  $\mathbf{F}$  appears unchanged or primed, see Section 1.3.2 above, as a coset representative of  $\mathbf{M}_T$ . For example, The coset representatives of  $\mathbf{F} = P222_1$  are

$$(1|0,0,0); \quad (2_x|0,0,0); \quad (2_y|0,0,1/2); \quad (2_z|0,0,1/2).$$

The coset representatives of  $\mathbf{M}_T = P2'2'2_1$  are:

$$(1|0,0,0); \quad (2_x|0,0,0)'; \quad (2_y|0,0,1/2)'; \quad (2_z|0,0,1/2).$$

The coset representatives of groups  $\mathbf{M}_R = \mathbf{F}(\mathbf{D})$  are also derived from the coset representatives of  $\mathbf{F}$ . They are also chosen such that they are also coset representatives of  $\mathbf{D}$  with respect to its subgroup  $\mathbf{T}^D$ . Each coset representative of  $\mathbf{F}$  appears either unchanged or multiplied by  $\mathbf{t}_a$ , see Section 1.3.2 above. For example: The coset representatives of  $\mathbf{F} = P222_1$  are

$$(1|0,0,0); \quad (2_x|0,0,0); \quad (2_y|0,0,1/2); \quad (2_z|0,0,1/2).$$

The coset representatives of  $M_R = P_{2a}2'2'2_1$ , where  $t_\alpha = (1,0,0)$ , are:

$$(1|0,0,0); \quad (2_x|1,0,0); \quad (2_y|1,0,\frac{1}{2}); \quad (2_z|0,0,\frac{1}{2}).$$

#### 1.4 Changes in Symbols

Typographical errors in Opechowski & Guccione (1965) corrected in Opechowski (1986) of three-dimensional magnetic space group types are as follows:

Numbering in Table 1.1	Opechowski & Guccione (1965)	Opechowski (1986)
16.4.102	$P_{2s}222$	$P_{2a}222$
43.4.323	$Fd'd'2$	$Fd'd'2$
47.6.352	$P_{2s}mmm$	$P_{2a}mmm$
67.17.593	$C_1m'm'a'$	$C_1m'ma'$
108.8.899	$I4'cm'$	$I_p4'cm'$
108.9.900	$I4c'm'$	$I_p4c'm'$
124.1.1018	$P4/mcr$	$P4/mcc$
132.4.1113	$P4_2/mcm'$	$P4_2'/mcm'$

In both Opechowski & Guccione (1965) and Opechowski (1986) the symbol  $P_{2b}c'ca$  is listed twice, in the numbering of Table 1.1, at entries 54.11.438 and 54.13.440. The second has been changed to  $P_{2b}c'ca'$ , a magnetic group which has a non-magnetic subgroup of the type  $Pnna$ .

Three more changes have been made:

Numbering in Table 1.1	Opechowski & Guccione (1965) Opechowski (1986)	Table 1.1
131.13.1109	$P_p 4_2'/m'mc$	$P_p 4_2'/m'mc'$
177.7.1385	$P_{2c} 6'22$	$P_{2c} 6'22'$
180.7.1402	$P_{2c} 6_2'22$	$P_{2c} 6_2'22'$

The reason for these changes are similar: For the middle case, the group P622 is listed in Table 1.1 as

177.1.1379	P622	$(1 0,0,0)$	$(3_z 0,0,0)$	$(3_z^{-1} 0,0,0)$
		$(2_z 0,0,0)$	$(6_z 0,0,0)$	$(6_z^{-1} 0,0,0)$
		$(2_x 0,0,0)$	$(2_{xy} 0,0,0)$	$(2_y 0,0,0)$
		$(2_1 0,0,0)$	$(2_2 0,0,0)$	$(2_3 0,0,0)$

177.7.1385 is a group with a  $P_{2c}$  lattice. The symbol 6' means that the coset representative  $(6_z|0,0,0)$  in the standard set of coset representatives of the coset decomposition of P622 with respect to P (listed in 177 .1.1379) appears as  $(6_z|0,0,1)$  in the standard set of coset representatives of the coset decomposition of the magnetic group with respect to  $P_{2c}$ . This implies the following coset representatives of 177.7.1385 :

$(1 0,0,0)$	$(3_z 0,0,0)$	$(3_z^{-1} 0,0,0)$
$(2_z 0,0,1)$	$(6_z 0,0,1)$	$(6_z^{-1} 0,0,1)$

The unprimed symbol 2 following the 6' implies that the coset representative  $(2_x|0,0,0)$  remains the same as a coset representative in 177.7.1385. Combining this with the

listed coset representatives implies the complete set of coset representatives found in

Table 1.1:

$(1 0,0,0)$	$(3_z 0,0,0)$	$(3_z^{-1} 0,0,0)$
$(2_z 0,0,1)$	$(6_z 0,0,1)$	$(6_z^{-1} 0,0,1)$
$(2_x 0,0,0)$	$(2_{xy} 0,0,0)$	$(2_y 0,0,0)$
$(2_1 0,0,1)$	$(2_2 0,0,1)$	$(2_3 0,0,1)$

Note that the coset representative  $(2_1|0,0,0)$  of the coset decomposition of P622 with respect to P now appears as the coset representative  $(2_1|0,0,1)$  in the coset decomposition of the magnetic group 177.7.1385 with respect to  $P_{2c}$ . Consequently, the second symbol 2 in P622, appears as 2' in the symbol of 177.7.1385, i.e. the symbol of this magnetic group is  $P_{2c} 6_2' 22'$ .

### 1.5 Relationship to Black and White Space Group Symbols

Opechowski & Guccione symbols (1965) for *all* group types in a three-dimensional magnetic superfamily of type **F** are based on the symbol of the three-dimensional space group **F**. For groups **F**, **F1'**, and **M<sub>T</sub>**, the Belov et al (1955, 1957) symbols do the same. However, for groups of the type **M<sub>R</sub> = F(D) = D + (F - D)1'** Belov et al (1955, 1957) base their symbol on the symbol for the group **D**, the unprimed subgroup of index 2. For example, the Opechowski & Guccione symbol for group 47.11.357 is  $P_C mmm'$ . From this we have that **F** = Pmmm and from Table 1.1 that **D** = Cmma. The Belov et al symbol for this group 47.11.357 is based on the symbol of the subgroup **D**, i.e. the symbol Cmma: A group **M<sub>R</sub>** can be written as **M<sub>R</sub> = F(D) = D + t<sub>α</sub>' D**, where t<sub>α</sub> is a translation of **F** not in **D**. For the group 47.11.357, this translation is chosen as  $a = (1,0,0)$  and is found in the figure for the  $P_C$  lattice in Figures 1.1. The

translational subgroup of this group is symbolically represented by Belov et al as  $C_a$  where C represents the translational subgroup of  $\mathbf{D} = Cmma$  and the subscript "a" denotes the translation  $t_a = a$ . This leads to the Belov et al symbol of  $C_a m'ma$  for the group 47.11.3 57.

A side by side comparison of Opechowski & Guccione symbols for three-dimensional magnetic space groups and Belov et al symbols for three-dimensional black and white space groups is given in Table 1.4-3D. As the Belov et al symbols for groups of type  $\mathbf{F}$ ,  $\mathbf{F1}'$  and  $\mathbf{M}_T$  are the same as Opechowski & Guccione symbols, we list Belov et al symbols explicitly only for groups of type  $\mathbf{M}_R$ . Comparisons of one- and two-dimensional magnetic space groups and black and white space groups are given, respectively, in Tables 1.4-1D and 1.4-2D.

## 2. Guide to the use of the magnetic space groups tables

### 2.1 Introduction

In this section we present a guide to the tabulation of properties of the superfamilies of one-, two-, and three-dimensional magnetic space groups given, respectively, in Table 3 - 1D, Table 3 -2D, and Table 3 - 3D. The format and content of these magnetic group tables are similar to the format and content of the space group tables in *ITC-A: International Tables for Crystallography, Volume A* (1983), the subperiodic group tables in the *ITC-E: International Tables for Crystallography, Volume E* (2002), and the same as that in the magnetic subperiodic group tables (Litvin, 2005).

### 2.2 Contents of the Magnetic Space Group Tables

The content of the magnetic group tables consists of the following:

- (1) Lattice Diagram
- (2) Headline
- (3) Diagrams of symmetry elements and of the general positions
- (4) Origin
- (5) Asymmetric unit
- (6) Symmetry operations
- (7) Generators selected
- (8) Positions, with multiplicities, site symmetries, coordinates, and magnetic moments
- (9) Symmetry of special projections

## 2.2.1 Lattice Diagram

In the upper left hand corner of the first page of tables for each magnetic space group is the lattice diagram of the magnetic space group. This lattice diagram depicts the coordinate system used, the conventional unit cell of the space group  $F$ , the magnetic space group's magnetic superfamily type, and the generators of the translational subgroup of the magnetic space group. For example, in Figures 2.2.1.1 and 2.2.1.2 we show the lattice diagrams for the orthorhombic magnetic space groups

**Figure 2.2.1.1:** Lattice Diagram of the group 26.1.168  $F = Pmc2_1$ .

**Figure 2.2.1.2:** Lattice Diagram of the group 26.10.177  $M_R = F(D) = P_{2b} m'c'2_1 = Pmc2_1(Pca2_1)$ .

$Pmc2_1$  and  $P_{2b} m'c'2_1$ , respectively. The generating lattice vectors depicted are color coded. Those colored black are not coupled with time inversion while those colored red are coupled with time inversion. In the former group  $Pmc2_1$ , a magnetic group of the type  $F$ , the lattice is an orthorhombic "P" lattice, see Figures 1.1, and no generating

translation is coupled with time inversion. In the latter group  $P_{2b} m'c'2_1$ , a magnetic group of type  $M_R$ , the lattice is an orthorhombic " $P_{2b}$ " lattice, with the generating lattice vector in the y-direction coupled with time inversion.

### 2.2.2 Headline

To the right of the lattice diagram is a two line heading, an example is given in Figure 2.2.2.1 . On the upper line, starting on the left, are three entries:

P4/m'mm	4/m'mm	Tetragonal
123.3.1001	P4/m'2'/m2'/m	

**Figure 2.2.2.1:** Headline of magnetic space group P4/m'mm.

(1) The *short international* (Hermann-Mauguin) *symbol* of the magnetic space group. Each symbol has two meanings: The first is that of the Hermann-Mauguin symbol of a magnetic space group type. The second is that of a specific magnetic space group which belongs to this magnetic space group type. Given a coordinate system, this group is defined both by the list of symmetry operations (see Section 2.2.6) given on the page with this Hermann-Mauguin symbol in the heading, or by the given list of general positions and magnetic moments (see Section 2.2.8).

(2) The *short international* (Hermann-Mauguin) *point group symbol* for the geometric class to which the magnetic space group belongs.

(3) The crystal system to which the magnetic space group belongs.

The second line has two additional entries:

(1) The three part numerical serial index of the magnetic space group (see

Section 1.3.1 ).

(2) The *long international (Hermann-Mauguin) symbol* of the magnetic space group.

### 2.2.3 Diagrams of symmetry elements and of the general positions

There are two types of diagrams, symmetry diagrams and general position diagrams. The symmetry diagrams show (1) the relative locations and orientations of the symmetry elements and (2) the locations and orientations of the symmetry elements relative to a given coordinate system. The general position diagrams show, in that coordinate system, the arrangement of a set of symmetrically equivalent points and relative orientations of magnetic moments on this set of equivalent points relative to the symmetry elements.

For the three-dimensional magnetic space groups, all diagrams are orthogonal projections and the projection direction is along the **c** basis vector, see Table 1.2 . If the other two basis vectors are not parallel to the plane of the diagram, they are indicated by a subscript "p" , e.g. **a<sub>p</sub>** and **b<sub>p</sub>** . Schematic representations of the diagrams, showing their conventional coordinate system, i.e. the origin "O" and basis vectors, are given in Figures 2.2.3.1 . The general position diagram is shown on the left and indicated by the letter "G". The symmetry diagram is on the right.

The graphical symbols used in the symmetry diagrams are listed in Table 2.2.3 and are an extension of those used in *ITC-A* (1983), *ITC-E* (2002) and Litvin (2005). For three-dimensional magnetic space groups, the symmetry planes and symmetry axes parallel to the plane of diagram, for rotoinversions, and for centers of symmetry, the "heights" *h* along the projection direction above the plane of the diagram are given.

The heights are given as fractions of the shortest translation along the projection direction and if different from zero, are printed next to the graphical symbol, see e.g. Figure 2.2.3.2 .

**Figure 2.2.3.2:** Symmetry diagram of the three-dimensional magnetic space group  $P4_12'2'$

In the general position diagrams, the general positions and corresponding magnetic moments are color coded. Positions with a z-component of "+z" are circles color coded red  and with a z-component of "-z" are circles color coded blue  . If the z-component is either "h+z" or "h-z" with  $h \neq 0$ , then the height "h" is printed next to the general position, e.g.   $\frac{1}{4}$  . If two general positions have the same x-component and y-component, with z-components +z and -z, respectively, the positions are denoted as  . The magnetic moments are color coded to the general position to which they are associated, their direction in the plane of projection is given by an

arrow in the direction of the magnetic moment. A "+" or "-" sign near the tip of the arrow indicates the magnetic moment is inclined, respectively, above or below the plane of projection, as in Figure 2.2.3.3 .

**Figure 2.2.3.3:** General position diagram of the three-dimensional magnetic space group  $P4_12'2'$

For magnetic space groups of the type  $F1'$  , the symmetry diagram is that of the group  $F$ . That each symmetry element also appears coupled with time inversion is represented by a red  $1'$  printed between and above the general position and symmetry diagrams. Because groups of this kind contain the time inversion symmetry, the magnetic moments are all identically zero, and no arrows appear in the general position diagram. An example, the diagrams of three-dimensional magnetic space group  $P4_1221'$  are shown in Figure 2.2.3.4:

**Figure 2.2.3.4:** Diagrams of three-dimensional magnetic space group  $P4_1221'$ .

## 2.2.4 Origin

If the magnetic space group is centrosymmetric then the inversion center or a position of high site symmetry, as on the four-fold axis of tetragonal groups, is chosen as the origin. For noncentrosymmetric groups, the origin is at a point of highest site symmetry. If no symmetry is higher than 1, the origin is placed on a screw axis, a glide plane or at the intersection of several such symmetries.

In the *Origin* line below the diagrams, the site symmetry of the origin is given. An additional symbol indicates all symmetry elements that pass through the origin. For example, for the three-dimensional magnetic space group  $I4/mcm$ , one finds "**Origin** at center (  $4/m$  ) at  $4/mc2_1/c$ ." The site symmetry is  $4/m$  and in addition, two glide planes perpendicular to the  $y$ - and  $z$ -axis, and a screw axis parallel to the  $z$ -axis pass through the origin.

## 2.2.5 Asymmetric Unit

An asymmetric unit of a magnetic space group is a simply connected smallest part of space from which, by application of all symmetry operations of the magnetic space group, exactly fills the whole space. Since the magnetic space groups contain a translational subgroup, the asymmetric unit is a finite part of space. We define the asymmetric unit by setting the limits on the coordinates of points contained in the asymmetric unit. For example, for the three-dimensional magnetic space group  $I4/m'cm$  (140.3.1198) one finds:

$$\text{Asymmetric unit } 0 \leq x \leq 1/2; 0 \leq y \leq 1/2; 0 \leq z \leq 1/4; y \leq 1/2 - x$$

Drawings showing the boundary planes occurring in the tetragonal, trigonal, and hexagonal systems, together with their algebraic equations are given in Figure 2.8.1 of *ITC-A* (1983). Drawings of asymmetric units for cubic groups have been published by Koch & Fisher (1974). The asymmetric units have complicated shapes in the trigonal, hexagonal, and cubic crystal systems and consequently are also specified by given the vertices of the asymmetric unit. For example, for the three-dimensional magnetic space group  $P6_3/m$  (176.1.1374) one finds:

$$\begin{array}{l} \text{Asymmetric unit } 0 \leq x \leq 2/3; \quad 0 \leq y \leq 2/3; \quad 0 \leq z \leq 1/4; \\ \quad x \leq (1+y)/2; \quad y \leq \min(1-x, (1+x)/2) \\ \text{Vertices } \begin{array}{cccccc} 0,0,0 & 1/2,0,0 & 2/3,1/3,0 & 1/3,2/3,0 & 0,1/2,0 \\ 0,0,1/4 & 1/2,0,1/4 & 2/3,1/3,1/4 & 1/3,2/3,1/4 & 0,1/2,1/4 \end{array} \end{array}$$

Because the asymmetric unit is invariant under time inversion, all magnetic space groups **F**, **F1'**, and **F(D)** of the magnetic superfamily of type **F** have identical asymmetric units.

### 2.2.6 Symmetry operations

Listed under the heading of *Symmetry operations* is the geometric description of the symmetry operations of the magnetic space group. In addition, each symmetry operation is also given in Seitz notation (Burns & Glazer, 1990). The corresponding coordinate triplets of the *General positions* may be interpreted as a second description of the symmetry operations, a description in matrix form. The numbering (1), (2), ... , (p), ... of the entries in the blocks *Symmetry operations* is the same as the numbering of the corresponding coordinate triplets of the *General positions*, the first block below *Positions*. For all magnetic space groups with primitive "P" lattices, the two lists, *Symmetry operations* and *General positions*, have the same number of entries.

For magnetic space groups with centered cells, only one block of several (2,3, or 4) blocks of the *General positions* is explicitly given. A set of (2,3, or 4) centering translations is given below the subheading *Coordinates*. Each of these translations is added to the given block of general positions to obtain the complete set of blocks of general positions. While one of the several blocks of general positions is explicitly given, the corresponding symmetry operations are all explicitly given. Each corresponding block of symmetry operations is listed under a subheading of "centering translation + set" for each centering translation listed below the subheading *Coordinates*.

A symbol denoting the geometric description of each symmetry operation is

given. Details of this symbolism, except for the use of prime to denote time inversion, are given in Section 11.2 of *ITC-A* (1983). For glide planes and screw axes the glide and screw part are always explicitly given in parentheses by fractional coordinates, i.e. by fractions of the basis vectors of the coordinate system of **F** of the superfamily of the magnetic group. A coordinate triplet indicating the location and orientation of the symmetry element is given, and for rotoinversions, the location of the inversion point is also given. These symbols, with the addition of a prime to denote time inversion, follow those used in *ITC-A* (1983), *ITC-E* (2002), and Litvin (2005).

### **2.2.7 Generators selected**

The line *Generators selected* lists the symmetry operations selected to generate the symmetrically equivalent points of the *General position* from a point with coordinates  $x, y, z$ . The first generator is always the identity operation given by (1) followed by generating translations. Additional generators are given as numbers (p) which refer to the coordinate triplets of the *General position* and to corresponding symmetry operations in the first block, if more than one, of *Symmetry operations*.

### **2.2.8 Positions, with multiplicities, site symmetries, coordinates, and magnetic moments**

The entries under *Positions*, referred to as *Wyckoff positions*, consists of the *General positions*, the upper block, followed by blocks of *Special positions*. The upper block of positions, the general positions, is a set of symmetrically equivalent points where each point is left invariant only by the identity operation or, for magnetic groups **F1'**, by the identity operation and time inversion, but by no other

symmetry operations of the magnetic space group. The lower blocks, the special positions, are a set of symmetrically equivalent points where each point is left invariant by at least one additional operation in addition to the identity operation, or , for magnetic space groups  $F1'$  , in addition to the identity operation and time inversion.

For each block of positions information is provided:

**Multiplicity:** The multiplicity is the number of equivalent positions in the conventional unit cell of the non-magnetic group  $F$  associated with the magnetic space group.

**Wyckoff Letter:** This letter is a coding scheme for the blocks of positions, starting with “a” at the bottom block and continuing upwards in alphabetical order.

**Site symmetry:** The site symmetry group is the largest subgroup of the magnetic space group that leaves invariant the first position in each block of positions. This group is isomorphic to a subgroup of the point group of the magnetic space group. An “oriented” symbol is used to show how the symmetry elements at a site are related to the conventional crystallographic basis and the sequence of characters in the symbol correspond to the sequence of symmetry directions as in the magnetic space group symbol, see Table 1.3. Sets of equivalent symmetry directions that do not contribute any element to the site symmetry are represented by dots. Sets of symmetry directions having more than one equivalent direction may require more than one character if the site-symmetry group belongs to a lower crystal system. For example, for the 2c position of the three-dimensional magnetic space group  $P4'm'm$  (99.3.825) the site symmetry group is  $2m'm'$ . where the two characters  $m'm'$  represent the secondary set of tetragonal symmetry directions, whereas the dot represents the tertiary tetragonal symmetry directions.

**Coordinates of Positions and Components of Magnetic Moments :** In each block of positions, the coordinates of each position are given. Immediately following each set of position coordinates are the components of the symmetry allowed magnetic moment at that position. The components of the magnetic moment of the first position is determined from the given site symmetry group. The components of the magnetic moments at the remaining positions are determined by applying the symmetry operations to the components of that magnetic moment at the first position.

### 2.2.9 Symmetry of special projections

Under the heading *Symmetry of special projections* the following information is given for the projections of each magnetic space group:

**Projection direction:** All projections are orthogonal, i.e. the projection, for three-dimensional magnetic space groups, is onto a plane normal to the projection direction.

The projection directions are:

Triclinic, Monoclinic, Orthorhombic	[001] [100] [010]
Tetragonal	[001] [100] [110]
Hexagonal	[001] [100] [210]
Rhombohedral	[111] [1 $\bar{1}$ 0] [2 $\bar{1}$ $\bar{1}$ ]
Cubic	[001] [111] [110]

For two-dimensional magnetic space groups, the projection is onto a line normal to the projection direction. The projection directions are:

Oblique	[10]	[01]
Rectangular	[10]	[01]
Square	[10]	[11]
Hexagonal	[10]	[21]

**Basis vectors:** For three-dimensional magnetic space groups, the relationship between the basis vectors  $\mathbf{a}^*$ ,  $\mathbf{b}^*$  of the two-dimensional magnetic space group symmetry of the projection is given in terms of the basis vectors  $\mathbf{a}, \mathbf{b}, \mathbf{c}$  of the three-dimensional magnetic space group. For triclinic and monoclinic three-dimensional magnetic space groups where basis vectors  $\mathbf{a}, \mathbf{b}$ , or  $\mathbf{c}$  are inclined to the plane of projection, these basis vectors are replaced by  $\mathbf{a}_p$ ,  $\mathbf{b}_p$ , or  $\mathbf{c}_p$ , respectively.

For two-dimensional magnetic space groups, the relationship between the basis vector  $\mathbf{a}^*$  of the one-dimensional magnetic space group symmetry of the projection is given in terms of the basis vectors  $\mathbf{a}$  and  $\mathbf{b}$  of the two-dimensional magnetic space group. For oblique two-dimensional magnetic space groups where basis vectors  $\mathbf{a}$  or  $\mathbf{b}$  are inclined to the plane of projection, these basis vectors are replaced by  $\mathbf{a}_p$  or  $\mathbf{b}_p$ , respectively.

**Location of origin:** For three-dimensional magnetic space groups, the location of the origin of the two-dimensional magnetic space group symmetry of the projection is given with respect to the unit cell of the three-dimensional magnetic space group. For two-dimensional magnetic space groups, the location of the origin of the one-dimensional magnetic space group symmetry of the projection is given with respect to the unit cell of the two-dimensional magnetic space group.

# Figures 1.1: Magnetic Space Group Lattices

Lattices with a first symbol consisting of a single letter with no subscript are lattices of groups  $\mathbf{F}$ ,  $\mathbf{F1}'$  and  $\mathbf{M}_T$ . To the right of an equality sign, a second symbol gives the generators of the lattice in the subscript of the corresponding lattice symbol. These generating translations are also shown as black arrows in the corresponding figure.

Lattices with a first symbol consisting of a letter with a second letter as a subscript are lattices of magnetic groups  $\mathbf{M}_R$ . The translational subgroup of these groups are of the form  $\mathbf{T}^M = \mathbf{T}^D + \mathbf{t}_\alpha' \mathbf{T}^D$ . To the right of equality signs, additional symbols are given which give the generating translations of  $\mathbf{T}^D$  as a subscript. The translation chosen for  $\mathbf{t}_\alpha$  is also explicitly given. In the corresponding figures, generating translations which are in  $\mathbf{T}^D$  are shown in black and generating translations which are in  $\mathbf{t}_\alpha' \mathbf{T}^D$  are shown in red.

**Appendix 1.1: On characterizing a change in coordinate systems and the non-magnetic subgroup of index two of magnetic groups.**

When given a subgroup  $\mathbf{D}$  of index 2 of a group  $\mathbf{F}$  we want to give enough information to show

- 1) how to change the origin and
- 2) how to change the basis vectors of the coordinate system

$(\mathbf{O}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  in which  $\mathbf{F}$  is defined, such in a second coordinate system  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$  the

translational subgroup of  $\mathbf{D}$  and the set of coset representatives of

$\mathbf{D}$  with respect to its translational subgroup will be identical with the translational subgroup and standard set of coset representatives of the group of type  $\mathbf{D}$  listed in the tables. Therefore:

- 1) We give, in the coordinate system of  $\mathbf{F}$ , the translation  $\mathbf{t}$  such that the new origin  $\mathbf{O}+\mathbf{t}$  is the origin of the coordinate system in which the subgroup  $\mathbf{D}$  will be of the form of the representative group  $\mathbf{D}$  listed in the tables.
- 2) We give the basis vectors  $\mathbf{a}', \mathbf{b}', \mathbf{c}'$  of a coordinate system  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$  in terms of the basis vectors of the coordinate system in which  $\mathbf{F}$  is defined, such that the subgroup  $\mathbf{D}$  in  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$  is identical with the representative group  $\mathbf{D}$ .

The lattices of both **F** and **D** can be either centered or primitive, consequently:

	Primitive	<b>F</b>	Centered
Primitive <b>D</b>	$\mathbf{a}', \mathbf{b}', \mathbf{c}'$ of primitive cell of <b>D</b> given in terms of $\mathbf{a}, \mathbf{b}, \mathbf{c}$ of primitive cell of <b>F</b> .		$\mathbf{a}', \mathbf{b}', \mathbf{c}'$ of primitive cell of <b>D</b> given in terms of $\mathbf{a}, \mathbf{b}, \mathbf{c}$ of the conventional unit cell of <b>F</b> .
Centered	$\mathbf{a}', \mathbf{b}', \mathbf{c}'$ of conventional unit cell of <b>D</b> given in terms of $\mathbf{a}, \mathbf{b}, \mathbf{c}$ of primitive cell of <b>F</b> .		$\mathbf{a}', \mathbf{b}', \mathbf{c}'$ of conventional unit cell of <b>D</b> given in terms of $\mathbf{a}, \mathbf{b}, \mathbf{c}$ of conventional unit cell of <b>F</b> .

To summarize: For the subgroup **D** we will give the following symbol:

$$\mathbf{D} ( \mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}' )$$

where **D** is the group type symbol for the group **D**, and  $( \mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}' )$  defines the new coordinate system  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$  in which the elements of **D** are identical with those of the representative group of the type **D**. Note that in the tables the symbol **t** is given by a trio of numbers  $n_a, n_b, n_c$  and the translation is defined by

$$\mathbf{t} = n_a \mathbf{a} + n_b \mathbf{b} + n_c \mathbf{c} ,$$

i.e. the translation **t** is defined in the coordinate system  $(\mathbf{O}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  of the group **F**. The symbol  $(\mathbf{O}+\mathbf{t}; \mathbf{a}', \mathbf{b}', \mathbf{c}')$  is to be interpreted to define the new coordinate system by *first* moving the origin and *then* inserting the new set of basis vectors at the new origin  $\mathbf{O}+\mathbf{t}$ .

The coset representatives of the group **D** change when changing the origin of

the coordinate system. How they change is as follows:

Given a coordinate system  $(\mathbf{O}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  and two points  $\mathbf{x}$  and  $\mathbf{x}'$  in this coordinate system. Given a second coordinate system  $(\mathbf{O}+\mathbf{t}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  where the two points corresponding to  $\mathbf{x}$  and  $\mathbf{x}'$  are in the second coordinate system denoted respectively by  $\mathbf{y}$  and  $\mathbf{y}'$ .

$$\mathbf{x} = \mathbf{y} + \mathbf{t}$$

$$\mathbf{x}' = \mathbf{y}' + \mathbf{t}$$

If  $\mathbf{x}$  and  $\mathbf{x}'$  are related by  $(R|\tau)$ , in the first coordinate system, how is this relationship represented in the second coordinate system between  $\mathbf{y}$  and  $\mathbf{y}'$  ?

$$\mathbf{x}' = (R|\tau)\mathbf{x}$$

$$\mathbf{x}' = R\mathbf{x} + \tau$$

$$\mathbf{y}' + \mathbf{t} = R(\mathbf{y} + \mathbf{t}) + \tau$$

$$\mathbf{y}' = R\mathbf{y} + \tau + R\mathbf{t} - \mathbf{t}$$

$$\mathbf{y}' = (R|\tau + R\mathbf{t} - \mathbf{t})\mathbf{y}$$

$$\mathbf{y}' = (E|-\mathbf{t})(R|\tau)(E|\mathbf{t})\mathbf{y}$$

Consequently, when the origin is moved from  $\mathbf{O}$  to  $\mathbf{O}+\mathbf{t}$ , the coset  $(R|\tau)$  in the first coordinate system  $(\mathbf{O}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  becomes, in the second coordinate system  $(\mathbf{O}+\mathbf{t}; \mathbf{a}, \mathbf{b}, \mathbf{c})$  the coset  $(E|-\mathbf{t})(R|\tau)(E|\mathbf{t}) = (R|\tau + R\mathbf{t} - \mathbf{t})$ , i.e. the rotational part remains the same, and  $R\mathbf{t}-\mathbf{t}$  is added to the translational part.

2.4.7	$p_{2a}m$	$pm$	(0;2a) (1 0) (m 0)

**Table 1.2: Relative Lengths and Mutual Orientations of Translation Vectors**

<b>Three-Dimensional</b>		
Conventional Coordinate System		
Crystal system	Restrictions on cell parameter	Parameters to be determined
-----	-----	-----
Triclinic	None	a,b,c; $\alpha, \beta, \gamma$
Monoclinic	$\alpha = \gamma = 90^\circ$	a,b,c; $\gamma$
Orthorhombic	$\alpha = \beta = \gamma = 90^\circ$	a,b,c
Tetragonal	$a = b; \alpha = \beta = \gamma = 90^\circ$	a,c
Trigonal	Hexagonal axes: $a = b;$ $\alpha = \beta = 90^\circ, \gamma = 120^\circ$	a,c
	Rhombohedral axes: $a = b = c; \alpha = \beta = \gamma$	a, $\alpha$
Hexagonal	$a = b;$ $\alpha = \beta = 90^\circ, \gamma = 120^\circ$	a,c
Cubic	$a = b = c; \alpha = \beta = \gamma = 90^\circ$	a
<b>Two-Dimensional</b>		
Oblique	None	a,b, $\gamma$
Rectangular	$\gamma = 90^\circ$	a,b
Square	$a = b$ $\gamma = 90^\circ$	a
Hexagonal	$a = b$ $\gamma = 120^\circ$	a
<b>One Dimensional</b>		
-----	None	a

**Table 1.3.1 : Symmetry directions and position in Hermann-Mauguin symbols**

Directions which belong to the same set of equivalent symmetry directions are given between braces. The first entry in each set is taken as the representative of that set.

**Three-Dimensional**

Symmetry direction  
(position in Hermann-Mauguin symbol)

Lattice	Primary	Secondary	Tertiary
Triclinic	None		
Monoclinic	$[010]$ unique axis b		
Orthorhombic	$[100]$	$[010]$	$[001]$
Tetragonal		$\begin{Bmatrix} [100] \\ [010] \end{Bmatrix}$	$\begin{Bmatrix} [1\bar{1}0] \\ [110] \end{Bmatrix}$
Hexagonal	$[001]$	$\begin{Bmatrix} [100] \\ [010] \\ [\bar{1}\bar{1}0] \end{Bmatrix}$	$\begin{Bmatrix} [1\bar{1}0] \\ [120] \\ [2\bar{1}0] \end{Bmatrix}$
Rhombohedral (hexagonal axes)	$[001]$	$\begin{Bmatrix} [100] \\ [010] \\ [\bar{1}\bar{1}0] \end{Bmatrix}$	
Cubic	$\begin{Bmatrix} [100] \\ [010] \\ [001] \end{Bmatrix}$	$\begin{Bmatrix} [111] \\ [1\bar{1}\bar{1}] \\ [\bar{1}1\bar{1}] \\ [\bar{1}\bar{1}1] \end{Bmatrix}$	$\begin{Bmatrix} [1\bar{1}0] & [110] \\ [01\bar{1}] & [011] \\ [\bar{1}01] & [101] \end{Bmatrix}$

## Two-Dimensional

Symmetry direction  
(position in Hermann-Mauguin symbol)

Lattice	Primary	Secondary	Tertiary

**Table 2.2.3-3D Graphical Symbols**

Three-Dimensional Magnetic Space Groups

**2.2.3.1 Symmetry axes parallel to the plane of projection**

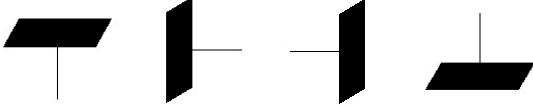

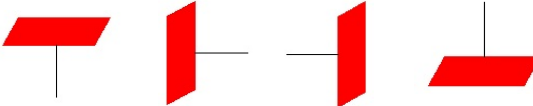

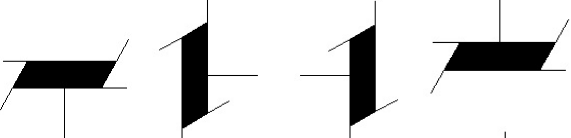

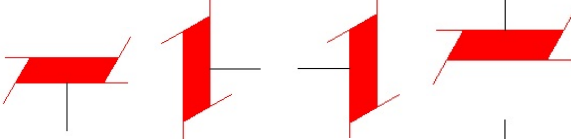

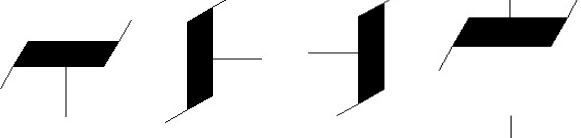

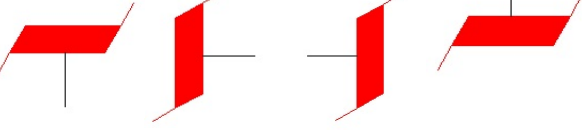

Symmetry Axis	Graphical symbol	Screw vector of a right-handed screw rotation in units of the shortest non-primed translation vector parallel to the axis.	Printed symbol
Twofold unprimed rotation axis,		None	2
Twofold primed rotation axis		None	2'
Twofold unprimed screw axis, 2 sub 1		1/2	2 <sub>1</sub>
Twofold primed screw axis, 2 sub 1 primed		1/2	2' <sub>1</sub>
Fourfold unprimed rotation axis		None	4
Fourfold primed rotation axis		None	4'
Fourfold unprimed screw axis, 4 sub 1		1/4	4 <sub>1</sub>
Fourfold primed screw axis, 4 sub 1 primed		1/4	4' <sub>1</sub>
Fourfold unprimed screw axis, 4 sub 2		1/2	4 <sub>2</sub>
Fourfold primed screw axis, 4 sub 2 primed		1/2	4' <sub>2</sub>

Table 2.2.3 - 1

Fourfold unprim screw axis, 4 sub 3		3/4	$4_3$
Fourfold unprim screw axis, 4 sub 3		3/4	$4_3$
unprimed Inversion axis, 4 bar		None	$\bar{4}$
primed inversion axis, 4 bar primed		None	$\bar{4}'$
Fourfold primed screw axis 4 sub1 prime and fourfold unprimed screw axis 4 sub 3		1/4,3/4	$4_1',4_3$

### 2.2.3.2 Symmetry axes normal to the plane of projection

Symmetry Axis or symmetry point	Graphical symbol	Screw vector of a right-handed screw rotation in units of the shortest non-primed translation vector parallel to the axis.	Printed symbol
Identity	None	None	1
Twofold unprimed rotation axis, 2		None	2
Twofold primed rotation axis, 2 primed		None	2'
Twofold unprimed screw axis, 2 sub 1		1/2	2 <sub>1</sub>
Twofold primed screw axis, 2 sub 1 primed		1/2	2' <sub>1</sub>

Table 2.2.3 - 2

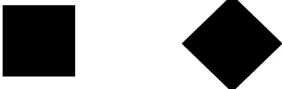

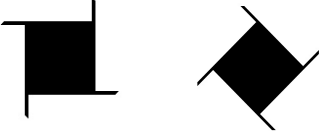

Threefold unprimed rotation axis, 3		None	3
Threefold primed rotation axis, 3 primed		None	3'
Threefold unprimed screw axis, 3 sub 1		1/3	3 <sub>1</sub>
Threefold primed screw axis, 3 sub 1 primed		1/3	3' <sub>1</sub>
Threefold unprimed screw axis, 3 sub 2		2/3	3 <sub>2</sub>
Threefold primed screw axis, 3 sub 2 primed		2/3	3' <sub>2</sub>
Fourfold unprimed rotation axis, 4		None	4
Fourfold primed rotation axis, 4 prime		None	4'
Fourfold unprimed screw axis, 4 sub 1		1/4	4 <sub>1</sub>
Fourfold primed screw axis, 4 sub 1 prime		1/4	4' <sub>1</sub>

Table 2.2.3 - 3

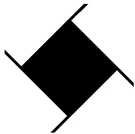

Fourfold unprimed screw axis, 4 sub 2			1/2	$4_2$
Fourfold primed screw axis, 4 sub 2 primed			1/2	$4_2'$
Fourfold unprimed screw axis, 4 sub 3			3/4	$4_3$
Fourfold primed screw axis, 4 sub 3 primed			3/4	$4_3'$
Sixfold unprimed rotation axis, 6			None	6
Sixfold primed rotation axis, 6 primed			None	6'
Sixfold unprimed screw axis, 6 sub 1			1/6	$6_1$
Sixfold primed screw axis, 6 sub 1 primed			1/6	$6_1'$
Sixfold unprimed screw axis, 6 sub 2			1/3	$6_2$
Sixfold primed screw axis, 6 sub 2 primed			1/3	$6_2'$

Table 2.2.3 - 4

Sixfold unprimed screw axis, 6 sub 3		1/2	$6_3$
Sixfold primed screw axis, 6 sub 3 primed		1/2	$6_3'$
Sixfold unprimed screw axis, 6 sub 4		2/3	$6_4$
Sixfold primed screw axis, 6 sub 4 primed		2/3	$6_4'$
Sixfold unprimed screw axis, 6 sub 5		5/6	$6_5$
Sixfold primed screw axis, 6 sub 5 primed		5/6	$6_5'$
Unprimed center of symmetry, unprimed inversion center, 1 bar		None	$\bar{1}$
Primed center of symmetry, primed inversion center, 1 bar primed		None	$\bar{1}'$
Twofold unprimed rotation axis with unprimed center of symmetry		None	$2, \bar{1} = 2/m$
Twofold primed rotation axis with unprimed center of symmetry		None	$2', \bar{1} = 2'/m'$

Table 2.2.3 - 5

Twofold unprimed rotation axis with primed center of symmetry		None	$2, \bar{1}' = 2/m'$
Twofold primed rotation axis with primed center of symmetry		None	$2', \bar{1}' = 2'/m'$
Twofold unprimed screw axis with unprimed center of symmetry		1/2	$2_1, \bar{1}$
Twofold primed screw axis with unprimed center of symmetry		1/2	$2_1', \bar{1}$
Twofold unprimed screw axis with primed center of symmetry		1/2	$2_1, \bar{1}'$
Twofold primed screw axis with primed center of symmetry		1/2	$2_1', \bar{1}'$
Twofold primed screw axis with unprimed twofold rotation axis		1/2	$2_1', 2$
Twofold unprimed screw axis with primed twofold rotation axis		1/2	$2_1, 2'$
Twofold primed screw axis, twofold unprimed rotation axis, and primed and unprimed centers of symmetry		1/2	$2_1', 2, \bar{1}, \bar{1}'$
Twofold unprimed screw axis, twofold primed rotation axis, and primed and unprimed centers of symmetry		1/2	$2_1, 2', \bar{1}', \bar{1}$

Table 2.2.3 - 6

Threefold unprimed rotation axis with unprimed center of symmetry, inversion axis 3 bar		None	$3, \bar{1} = \bar{3}$	
Threefold unprimed rotation axis with primed center of symmetry, inversion axis 3 bar prime		None	$3, \bar{1}' = \bar{3}'$	
Threefold unprimed rotation axis with primed and unprimed centers of symmetry		None	$3, \bar{1}', \bar{1}$	
Fourfold unprimed rotation axis with unprimed center of symmetry			None	$4, \bar{1} = 4/m$
Fourfold primed rotation axis with unprimed center of symmetry			None	$4', \bar{1} = 4'/m$
Fourfold unprimed rotation axis with primed center of symmetry			None	$4, \bar{1}' = 4'/m'$
Fourfold primed rotation axis with primed center of symmetry			None	$4, \bar{1}' = 4'/m'$
Fourfold unprimed screw axis with unprimed center of symmetry			1/2	$4_2, \bar{1}$
Fourfold primed screw axis with unprimed center of symmetry			1/2	$4_2', \bar{1}$
Fourfold unprimed screw axis with primed center of symmetry			1/2	$4_2, \bar{1}'$

Table 2.2.3 - 7

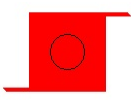

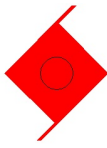

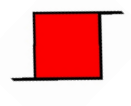

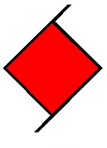

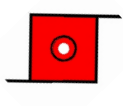

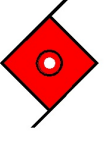

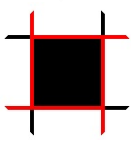

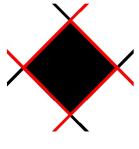

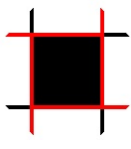

Fourfold primed screw axis with primed center of symmetry			1/2	$4_2', \bar{1}'$
Fourfold primed screw axis with fourfold unprimed rotation axis			1/2	$4_2', 4$
Fourfold unprimed screw axis with fourfold primed rotation axis			1/2	$4_2, 4'$
Fourfold primed screw axis, fourfold unprimed rotation axis and primed and unprimed center of symmetry			1/2	$4_2', 4, \bar{1}', \bar{1}$
Fourfold unprimed screw axis, fourfold primed rotation axis, and primed and unprimed center of symmetry			1/2	$4_2, 4', \bar{1}', \bar{1}$
Fourfold unprimed screw axis 4 sub1 and fourfold primed screw axis 4 sub 3 prime			1/4, 3/4	$4_1, 4_3'$
Fourfold primed screw axis 4 sub1 prime and fourfold unprimed screw axis 4 sub 3			1/4, 3/4	$4_1', 4_3$
Unprimed inversion axis 4 bar			None	$\bar{4}, 2 = \bar{4}$
Primed inversion axis 4 bar prime			None	$\bar{4}', 2 = \bar{4}'$
Primed and unprimed inversion axes 4 bar and 4 bar prime, and primed twofold screw axis			1/2	$\bar{4}, 2 = \bar{4}$ $\bar{4}', 2 = \bar{4}'$ $2_1'$

Table 2.2.3 - 8

Sixfold unprimed rotation axis with unprimed center of symmetry		None	$6, \bar{1} = 6/m$
Sixfold primed rotation axis with unprimed center of symmetry		None	$6', \bar{1} = 6'/m$
Sixfold unprimed rotation axis with primed center of symmetry		None	$6, \bar{1}' = 6/m'$
Sixfold primed rotation axis with primed center of symmetry		None	$6', \bar{1}' = 6'/m'$
Sixfold unprimed screw axis 6 sub 3 with unprimed center of symmetry		1/2	$6_3, \bar{1}$
Sixfold primed screw axis 6 sub 3 prime with unprimed center of symmetry		1/2	$6_3', \bar{1}$
Sixfold unprimed screw axis 6 sub 3 with primed center of symmetry		1/2	$6_3, \bar{1}'$
Sixfold primed screw axis 6 sub 3 prime with primed center of symmetry		1/2	$6_3', \bar{1}'$
Sixfold unprimed rotation axis, sixfold primed screw axis 6 sub 3 prime		1/2	$6_3', 6$
Sixfold primed rotation axis, sixfold unprimed screw axis 6 sub 3		1/2	$6_3, 6'$

Table 2.2.3 - 9

Sixfold unprimed rotation axis, sixfold primed screw axis 6 sub 3 prime, with primed and unprimed centers of symmetry		1/2	$\frac{6_3', 6}{\bar{1}, \bar{1}'}$
Sixfold primed rotation axis, sixfold unprimed screw axis 6 sub 3, with primed and unprimed centers of symmetry		1/2	$\frac{6_3', 6}{\bar{1}, \bar{1}'}$
Unprimed inversion axis 6 bar		None	$\bar{6}$
Primed inversion axis 6 bar prime		None	$\bar{6}'$
Primed and unprimed inversion axes, 6 bar prime and 6 bar		None	$\bar{6}', \bar{6}$
Primed and unprimed centers of symmetry		None	$\bar{1}, \bar{1}'$

### 2.2.3.3 Symmetry planes normal to the plane of projection

Symmetry plane	Graphical symbol	Glide vector in units of unprimed lattice translation parallel and normal to the projection plane	Printed symbol
Unprimed reflection plane		None	m
Primed reflection plane		None	m'
Unprimed axial glide plane		1/2 along line parallel to projection plane	a,b

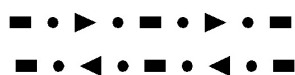

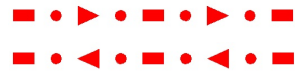

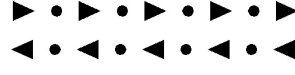

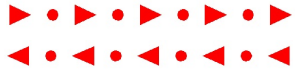

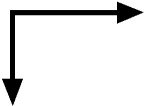

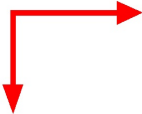

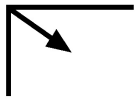

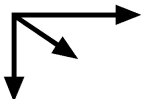

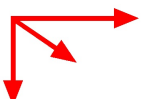

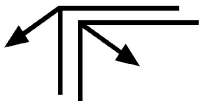

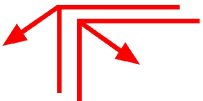

Primed axial glide plane		1/2 along line parallel to projection plane	a',b'
Unprimed axial glide plane		1/2 along line normal to projection plane	c
Primed axial glide plane		1/2 along line normal to projection plane	c'
Unprimed diagonal glide plane		One glide plane with two components: 1/2 along line parallel to projection plane <i>and</i> 1/2 normal to projection plane	n
Primed diagonal glide plane		One glide plane with two components: 1/2 along line parallel to projection plane <i>and</i> 1/2 normal to projection plane	n'
Unprimed diamond glide plane		One glide plane with two components: 1/4 along line parallel to projection plane in direction of arrow <i>and</i> 1/4 up normal to projection plane	d
Primed diamond glide plane		One glide plane with two components: 1/4 along line parallel to projection plane in direction of arrow <i>and</i> 1/4 up normal to projection plane	d'
Unprimed diamond glide plane		One glide plane with two components: 1/4 along line parallel to projection plane in direction of arrow <i>and</i> 3/4 up normal to projection plane	d
Primed diamond glide plane		One glide plane with two components: 1/4 along line parallel to projection plane in direction of arrow <i>and</i> 3/4 up normal to projection plane	d'
Unprimed axial glide planes		Two glide planes each with one component: 1/2 along line parallel to projection plane; 1/2 normal to projection plane	a,b; c

Table 2.2.3 - 11

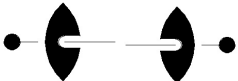

Primed axial glide planes		Two glide planes each with one $a, b, c$ component: $1/2$ along line parallel to projection plane; $1/2$ normal to projection plane
Unprimed axial glide plane and primed axial glide plane		Two glide planes each with one $a', b', c$ component: $1/2$ along line parallel to projection plane; $1/2$ normal to projection plane
Unprimed axial glide plane and primed axial glide plane		Two glide planes each with one $a, b, c'$ component: $1/2$ along line parallel to projection plane; $1/2$ normal to projection plane

#### 2.2.3.4 Symmetry planes parallel to the plane of projection

Symmetry plane	Graphical symbol	Glide vector in units of unprimed lattice translation parallel to the projection plane	Printed symbol
Unprimed reflection plane		None	$m$
Primed reflection plane		None	$m'$
Unprimed axial glide plane		$1/2$ along direction parallel to arrow	$a, b$
Primed axial glide plane		$1/2$ along direction parallel to arrow	$a', b'$
Unprimed double glide plane		Two glide planes each with one component $1/2$ along directions parallel to the two arrows	$a, b$

Primed double glide plane		Two glide planes each with one component 1/2 along directions parallel to the two arrows	a',b'
Unprimed diagonal glide plane		1/2 along direction parallel to arrow	n
Primed diagonal glide plane		1/2 along direction parallel to arrow	n'
Unprimed double glide plane and unprimed diagonal glide plane		Three glide planes each with one component 1/2 along directions parallel to the three arrows	a,b,n
Primed double glide plane and primed diagonal glide plane		Three glide planes each with one component 1/2 along directions parallel to the three arrows	a',b',n'
Unprimed double diagonal glide planes		Two glide planes each with one component 1/2 along directions parallel to the two arrows	d
Primed double diagonal glide planes		Two glide planes each with one component 1/2 along directions parallel to the two arrows	d'

### 2.2.3.5 Symmetry axes inclined to the plane of projection (in cubic magnetic space groups only)

Symmetry plane	Graphical symbol	Screw vector of a right-handed screw rotation in units of the shortest unprimed lattice translation parallel to the axis	Printed symbol
Unprimed twofold rotation axis parallel to a face diagonal of the cube		None	2

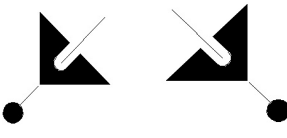

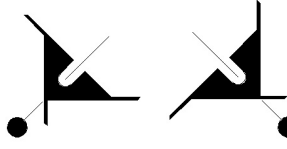

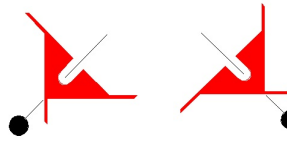

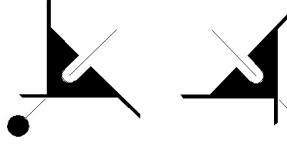

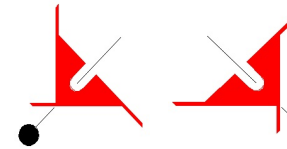

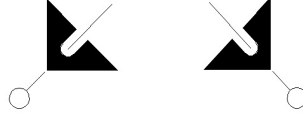

Primed twofold rotation axis parallel to a face diagonal of the cube		None	$2'$
Unprimed twofold screw axis 2 sub 1 parallel to a face diagonal of the cube		$1/2$	$2_1$
Primed twofold screw axis 2 sub 1 prime parallel to a face diagonal of the cube		$1/2$	$2_1'$
Unprimed threefold rotation axis parallel to a body diagonal of the cube		None	$3$
Unprimed threefold screw axis 3 sub 1 parallel to a body diagonal of the cube		$1/3$	$3_1$
Primed threefold screw axis 3 sub 1 prime parallel to a body diagonal of the cube		$1/3$	$3_1'$
Unprimed threefold screw axis 3 sub 2 parallel to a body diagonal of the cube		$2/3$	$3_2$
Primed threefold screw axis 3 sub 2 prime parallel to a body diagonal of the cube		$2/3$	$3_2'$
Unprimed inversion axis 3 bar parallel to a body diagonal of the cube		None	$3, \bar{1} = \bar{3}$

Table 2.2.3 - 14

### 2.2.3.6 Symmetry planes inclined to the plane of projection (in cubic magnetic space groups only)

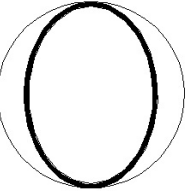

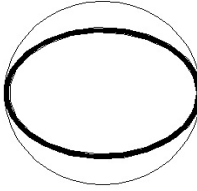

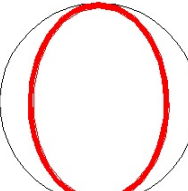

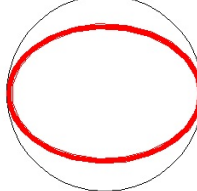

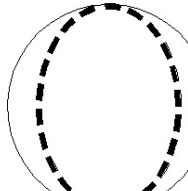

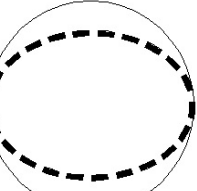

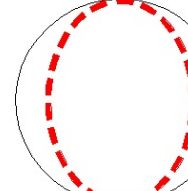

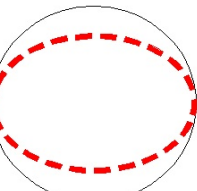

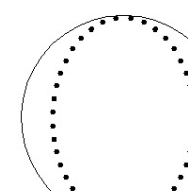

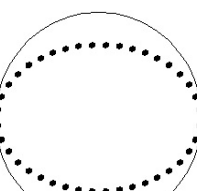

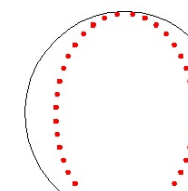

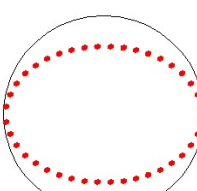

Symmetry Plane Symbol	Graphical symbol for planes normal to [011] and $[0\bar{1}\bar{1}]$ ; [101] and $[10\bar{1}]$	Glide vectors in units of unprimed lattice translation for planes normal to [011] and $[0\bar{1}\bar{1}]$ ; [101] and $[10\bar{1}]$	Printed		
Unprimed Reflection plane			None	None	m
Primed Reflection plane			None	None	m'
Unprimed axial glide plane			1/2 along [100]	1/2 along [010]	a,b
Primed axial glide plane			1/2 along [100]	1/2 along [010]	a',b'
Unprimed axial glide plane			1/2 along $[0\bar{1}\bar{1}]$ or [011]	1/2 along $[10\bar{1}]$ or [101]	
Unprimed axial glide plane			1/2 along $[0\bar{1}\bar{1}]$ or [011]	1/2 along $[10\bar{1}]$ or [101]	

Table 2.2.3 - 15

Unprimed double glide plane

Two glide vectors: 1/2 along [100] and 1/2 along  $[0\bar{1}\bar{1}]$  or  $[011]$

Two glide vectors: 1/2 along [010] and 1/2 along  $[10\bar{1}]$  or  $[101]$

Primed double glide plane

Two glide vectors: 1/2 along [100] and 1/2 along  $[0\bar{1}\bar{1}]$  or  $[011]$

Two glide vectors: 1/2 along [010] and 1/2 along  $[10\bar{1}]$  or  $[101]$

Unprimed diagonal glide plane

1/2 along  $[1\bar{1}\bar{1}]$  or  $[111]$

1/2 along  $[1\bar{1}\bar{1}]$  or  $[111]$

n

Primed diagonal glide plane

1/2 along  $[1\bar{1}\bar{1}]$  or  $[111]$

1/2 along  $[1\bar{1}\bar{1}]$  or  $[111]$

n'

Unprimed diamond glide plane

1/2 along  $[1\bar{1}\bar{1}]$  or  $[111]$

1/2 along  $[\bar{1}11]$  or  $[111]$

d

1/2 along  $[\bar{1}11]$  or  $[\bar{1}\bar{1}\bar{1}]$

1/2 along  $[\bar{1}11]$  or  $[\bar{1}\bar{1}\bar{1}]$

d

Table 2.2.3 - 16

Primed diamond glide plane			1/2 along $[\bar{1}\bar{1}1]$ or $[111]$	1/2 along $[\bar{1}11]$ or $[1\bar{1}1]$	d'
			1/2 along $[\bar{1}\bar{1}1]$ or $[\bar{1}11]$	1/2 along $[\bar{1}\bar{1}1]$ or $[\bar{1}11]$	d'
Unprimed axial glide planes			Two glide vectors: 1/2 along $[100]$ and 1/2 along $[011]$	Two glide vectors: 1/2 along $[010]$ and 1/2 along $[101]$	
Unprimed axial glide planes			Two glide vectors: 1/2 along $[100]$ and 1/2 along $[01\bar{1}]$	Two glide vectors: 1/2 along $[010]$ and 1/2 along $[10\bar{1}]$	
Primed axial glide planes			Two glide vectors: 1/2 along $[100]$ and 1/2 along $[011]$	Two glide vectors: 1/2 along $[010]$ and 1/2 along $[101]$	
Primed axial glide planes			Two glide vectors: 1/2 along $[100]$ and 1/2 along $[01\bar{1}]$	Two glide vectors: 1/2 along $[010]$ and 1/2 along $[10\bar{1}]$	

Table 2.2.3 - 17

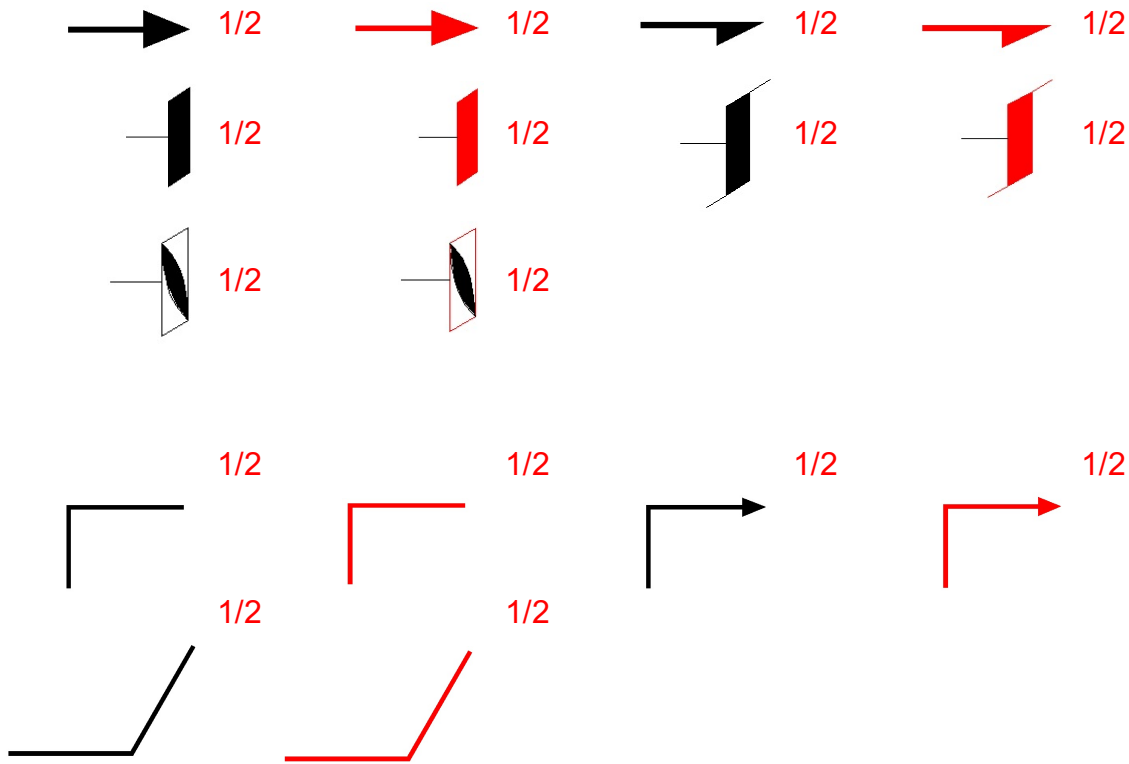

Unprimed diamond glide plane			1/2 along $[\bar{1}\bar{1}1]$ or $[\bar{1}11]$	1/2 along $[\bar{1}\bar{1}1]$ or $[111]$	d
			1/2 along $[\bar{1}\bar{1}1]$ or $[111]$	1/2 along $[\bar{1}\bar{1}1]$ or $[\bar{1}\bar{1}1]$	d
Primed diamond glide plane			1/2 along $[\bar{1}\bar{1}1]$ or $[\bar{1}11]$	1/2 along $[\bar{1}\bar{1}1]$ or $[111]$	d'
			1/2 along $[\bar{1}\bar{1}1]$ or $[111]$	1/2 along $[\bar{1}\bar{1}1]$ or $[\bar{1}\bar{1}1]$	d'

Table 2.2.3 - 18

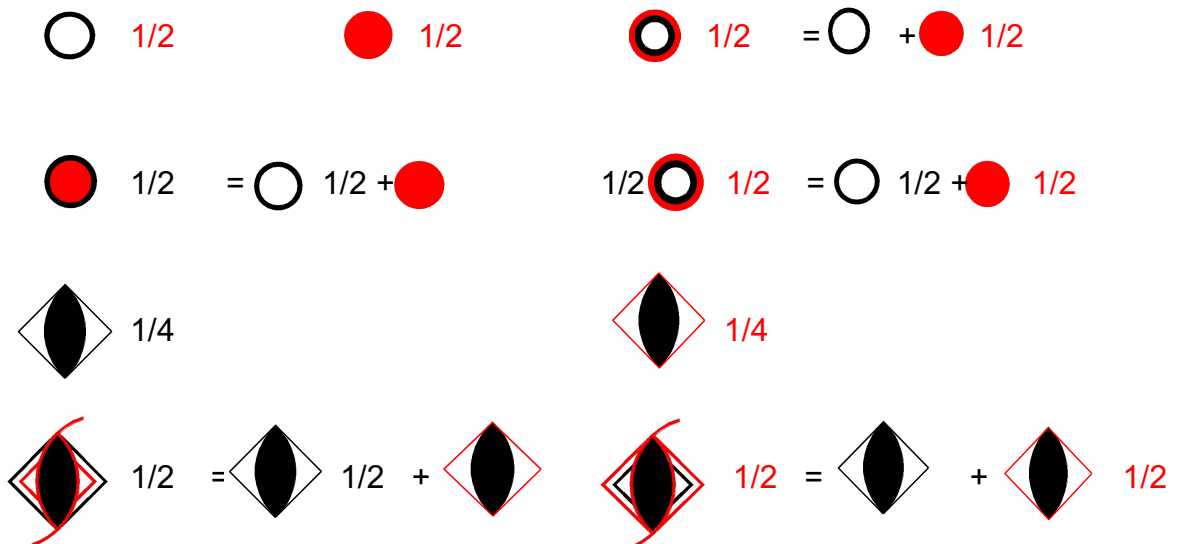

### 2.2.3.7 Height of symmetry operations above plane of projection

Heights are given as a fraction of the shortest primed or unprimed translation perpendicular to the plane of projection. Fractions are color coded black and red corresponding to related unprimed and primed operations, respectively. Examples are as follows:

#### 2.2.3.7a Rotation axes, screw axes, inversion axes and reflection and glide planes parallel to the plane of projection

#### 2.2.3.7b Inversion centers and inversion axes perpendicular to the plane of projection (i.e. height of inversion center of rotation-inversion)

**Table 2.2.3-2D Graphical Symbols**

Two-Dimensional Magnetic Space Groups

Symmetry	Graphical Symbol	Printed Symbol
Unprimed reflection line, mirror line		m
Primed reflection line, mirror line		m'
Unprimed glide line, 1/2 lattice vector along line in plane		g
Primed glide line, 1/2 lattice vector along line in plane		g'
Unprimed two-fold rotation point		2
Primed two-fold rotation point		2'
Unprimed three-fold rotation point		3
Primed three-fold rotation point		3'
Unprimed four-fold rotation point		4
Primed four-fold rotation point		4'
Unprimed six-fold rotation point		6
Primed six-fold rotation point		6'

### Table 2.2.3-1D Graphical Symbols

#### One-Dimensional Magnetic Space Groups

Symmetry	Graphical Symbol	Printed Symbol
Unprimed point of reflection		m
Primed point of reflection		m'
