## SUPPLEMENTARY MATERIAL

## Generation of errors for the synthetic SAXS curve

The error-to-intensity ratio ( $k_{\text {exp }}$ ) was calculated by using the data points of a good quality experimental SAXS curve (measured from a sample having a concentration >10 $\mathrm{mg} / \mathrm{ml}$ (Tobias Madl, personal communication)) (Figure S1). A second order Gaussian Error Function provided the best fit to $k_{\text {exp }}$ (with $\mathrm{R}^{2}: 0.97$ and RMSE: 0.01 ), which is used to simulate error-to-intensity ratio, $k_{\text {sim }}$ for the s-range between 0.02 and 0.5 , for the intensity range between -0.5 and 0.25 :

$$
\begin{equation*}
k_{\operatorname{sim}} s=a_{1} \exp -{\frac{s-b_{1}}{c_{1}}}^{2}+a_{2} \exp -{\frac{s-b_{2}}{c_{2}}}^{2} \tag{1}
\end{equation*}
$$

The coefficients of $k_{\text {sim }}$ and their confidence bounds (with $95 \%$ of confidence level) were determined to be:

| $\mathrm{a}_{1}$ | $\mathrm{~b}_{1}$ | $\mathrm{c}_{1}$ |
| :---: | :---: | :---: |
| $0.2177(0.2158,0.2196)$ | $0.4238(0.419,0.4286)$ | $0.2044(0.1984,0.2104)$ |

| $\mathrm{a}_{2}$ | $\mathrm{~b}_{2}$ | $\mathrm{c}_{2}$ |
| :---: | :---: | :---: |
| $0.0642(0.0574,0.071)$ | $0.2407(0.238,0.2437)$ | $0.0861(0.0794,0.09285)$ |

For a realistic error estimation, $k_{\text {sim }}$ was randomly chosen within the confidence interval ( $95 \%$ ) of the Gaussian Error Function (by using the rand function of MATLAB (2009)). An illustration of the randomly simulated $k_{\text {sim }}$ is presented in Figure S1.

Figure S1. The evaluation of the real ( $k_{\text {exp }}$ ) and simulated ( $\boldsymbol{k}_{\text {sim }}$ ) error-tointensity ratio. The $k_{\text {exp }}$ (black crosses) was calculated by using the data points of a good quality experimental SAXS curve, whereas $k_{\text {sim }}$ (red dots) was randomly chosen within the confidence interval (95\%) of the Gaussian Error Function (Eqn 1.), which was fit to $k_{\text {exp. }}$

## Impact of flexible refinement on 138 successful cases of the Docking Benchmark 4.0

The overall performance after water refinement for the HADDOCK and HADDOCK $_{\text {Saxs }}$ scoring functions are presented in Figure S2.

Figure S2. Performance comparison of HADDOCK (blue) and HADDOCK ${ }_{\text {SAXS }}$ (red) at the end of the water refinement stage (calculated over 138 successful cases).
