## SUPPLEMENTARY MATERIAL

Supplementary Fig. S1. Electron density map calculated with coefficients $\left|2 \mathrm{~F}_{\text {obs }}-\mathrm{F}_{\text {calc }}\right|$. Contour level at $1.5 \sigma$. Only $\beta$-strands from residues 20 to 137 are shown.

Supplementary Fig. S2. Schematic representation of HP1028 topology. B-strands are represented as red arrows, $\alpha$-helices as cyan cylinders. N and C indicates the N - and C-terminus, respectively.

Supplementary Fig. S3. Overall view of the surface of the two monomers in the asymmetric unit, with a PEG chain fitted inside the cavity. The electron density of the ligand extends from one monomer to the other, but does not fill in the entire cavity till the bottom.

Supplementary Fig. S4. Stereo view of the electron density of the ligand present in HP1028 cavity. The electron density is calculated as in Fig. S1. The ligand extends inside a second HP1028 molecue, not shown for clarity of the drawing.

Supplementary Fig. S5. Stereo view of the residues present in the loops at the opening of the protein cavity and forming the interaction surface between the two monomers in the crystal. The C atoms of the two different monomers are shown in green and cyan.

SupplementaryTable. S1. List of protein structures that, according to DALI server $\{\{1050$ Holm,L. 2010;\}\}, bear a structural similarity to HP1028. Only one representative structure is reported for each protein. Proteins are listed according to the Z score. Columns 4 and 5 gives the total number and the number of residues aligned, respectively. Column 6 the percentage of identity, column 6 the PDB ID code, followed by the label of the chain considered. Only one member for each protein is reported in the Table.

| Protein name | R.m.s.d. ( ${ }^{\text {( }}$ ) | Z score | N. Res. | Aligned | identity | PDB ID |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
