## Supporting information

## Single-crystal X-ray diffraction

Figure S1 Two 7OS5 crystals (sized $0.50 \mathrm{~mm} \times 0.08 \mathrm{~mm} \times 0.02 \mathrm{~mm}$ and $0.36 \mathrm{~mm} \times 0.03 \mathrm{~mm} \times$ 0.01 mm - the top one and the bottom one, respectively) and their SC-XRD patterns proving that they are actually aggregates of a number of crystallites (XtaLAB P200 MM007-DW (Rigaku) single crystal diffractometer; $\mathrm{CuK} \alpha$; PILATUS 200k detector).

Figure S2 The small, needle-shaped (sized $0.38 \mathrm{~mm} \times 0.02 \mathrm{~mm} \times 0.01 \mathrm{~mm}$ ) single crystal of 7OS5 selected for structure determination with its diffraction pattern (SuperNova (Agilent Technologies) diffractometer; $\mathrm{CuK} \alpha$; Atlas CCD detector (2x2k) and mirror monochromator). The long axis of the needle is along the $b$ direction.

Polarizing optical microscopy (POM)

Figure S3 Textures of 7OS5 registered during cooling from isotropic liquid (a-c) and subsequent heating (d-f) at the $6^{\circ} \mathrm{C} \mathrm{min}^{-1}$ rate.

## Principal axis strain calculations

Principal axis strain calculator PASCal (http://pascal.chem.ox.ac.uk) was used for analysis of the temperature variation of the lattice parameters of 7OS5 single crystal on heating.

Table S1. Input data for PASCal.

| phase | $\mathrm{T}[\mathrm{K}]$ | $\Delta \mathrm{T}[\mathrm{K}]$ | $a[\AA]$ | $b[\AA]$ | $c[\AA]$ | $\alpha[\mathrm{deg}]$ | $\beta[\mathrm{deg}]$ | $\gamma[\mathrm{deg}]$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

|  | 193 | 0.5 | 54.28 | 5.573 | 15.333 | 90 | 93.24 | 90 |
|  | 213 | 0.5 | 54.41 | 5.5852 | 15.439 | 90 | 92.31 | 90 |

Table S2. Coefficients of thermal expansion (CTEs) along principal directions $x_{i}$, volume principal thermal expansivity and the relationship between the principal axes and the crystallographic axes.

| phase | i-th principal axis | $\begin{gathered} \alpha_{\mathrm{i}} \\ {\left[10^{-6} \mathrm{~K}^{-1}\right]} \\ \hline \end{gathered}$ |  |  | $c$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Cr I | 1 | -65(12) | -1.0000 | 0.0000 | 0.0000 |
|  | 2 | 27(4) | 0.0000 | 1.0000 | 0.0000 |
|  | 3 | 404(24) | 0.0000 | 0.0000 | 1.0000 |
|  | V | 367(15) |  |  |  |
| Cr II | 1 | -80(14) | -0.4216 | 0.0000 | 0.9068 |
|  | 2 | 41(7) | 0.0000 | 1.0000 | 0.0000 |
|  | 3 | 297(37) | 0.1782 | 0.0000 | 0.9840 |
|  | V | 277(29) |  |  |  |

Cr I phase: area CTE: $\alpha_{2}+\alpha_{3}=431(28) \cdot 10^{-6} \mathrm{~K}^{-1}$ and linear CTE: $\alpha_{1}=-65(12) \cdot 10^{-6} \mathrm{~K}^{-1}$ the principal axes coincide with the crystallographic axes

Cr II phase: area CTE: $\alpha_{2}+\alpha_{3}=338(44) \cdot 10^{-6} \mathrm{~K}^{-1}$ and linear CTE: $\alpha_{1}=-80(14) \cdot 10^{-6} \mathrm{~K}^{-1}$ only the $b$-direction is common for the principal and the crystallographic axis

## Determination of structural parameters characterising the short-range order in liquid crystalline phases of 7055

In the nematic phase, the correlation length $\xi_{\|}$in the direction parallel to the director was obtained by fitting an asymmetric Lorentz curve to the diffuse maximum at $2 \theta \approx 3^{\circ}$ (Figure S4(a)):

$$
I(q)=\left\{\begin{array}{l}
\frac{A}{1+\xi_{\| 1}^{2}\left(q-q_{0}\right)^{2}}+B q+C \text { for } q<q_{0}  \tag{S1}\\
\frac{A}{1+\xi_{\| 2}^{2}\left(q-q_{0}\right)^{2}}+B q+C \text { for } q>q_{0}
\end{array},\right.
$$

where $\xi_{\| \mid}=2 \xi_{\| 1} \xi_{\| 2} /\left(\xi_{| | 1}+\xi_{\| \mid 2}\right)$ is the harmonic mean of $\xi_{| | 1}$ and $\xi_{| | 2}, A$ is the peak amplitude, $q_{0}$ is the position of the maximum, $B$ and $C$ are the parameters of the linear background.

The correlation length $\xi_{\perp}$ in the direction perpendicular to the director was obtained by fitting the symmetric Lorentz curve to the diffuse maximum at $2 \theta \approx 20^{\circ}$ (Figure S4(b)):

$$
\begin{equation*}
I(q)=\frac{A}{1+\xi_{1}^{2}\left(q-q_{0}\right)^{2}}+B q+C . \tag{S2}
\end{equation*}
$$

The scattering vector values were calculated as $q=4 \pi \sin \theta / \lambda_{\text {CuK } \alpha}$ using the weighted average $\lambda_{\text {CuK } \alpha}=\frac{2}{3} \lambda_{\text {CuK } \alpha 1}+\frac{1}{3} \lambda_{\text {CuK } \alpha 2}$.

Figure S4 Diffuse maxima visible in the powder diffraction patterns of the nematic phase of 7OS5 at $q_{0}=0.24 \AA^{-1}$ (a) and at $q_{0}=1.4 \AA^{-1}$ (b) with the fitting results of Equation S1 and Equation S2, respectively; results for $40^{\circ} \mathrm{C}$ during cooling.
