#### Crystals used for in-house experiments:

**Figure S1.** The crystal seen in figure S1A, with dimensions 200x160x100  $\mu\text{m}$ , was used for the in-house experiments at the Synergy-S and Supernova diffractometers. The crystal in Figure S1B was used for the Stadivari experiment, and has the dimensions 190x140x100  $\mu\text{m}$ .

#### Diffraction experiment run lists:

All angles are given in degrees [°].

SPring8 25K:

$\omega$  scans at different  $2\theta$  and  $\chi$ . 0.1 °/frame. Exposure time 0.14 s. Detector distance 130 mm.

| Run nr | $2\theta$ | $\chi$ | $\omega$ start | $\omega$ end |
|--------|-----------|--------|----------------|--------------|
| 1      | 0         | 0      | 0              | 180          |
| 2      | 0         | -20    | 0              | 180          |
| 3      | 0         | -40    | 0              | 180          |

| 5      | 20        | -20    | 0              | 180          |
| 6      | 20        | -40    | 0              | 180          |

Stadivari:

$\omega$  scans at different  $2\theta$ ,  $\chi$  and  $\varphi$  angles.  $0.5^\circ/\text{frame}$ . Exposure time as given in the table. Detector distance 60 mm.

| Run nr | $2\theta$ | Exp. Time [s] | $\chi$ | $\varphi$ | $\omega$ start | $\omega$ end |

### Test for $I/\sigma$ cutoff:

**Figure S2.** Quadrupole populations and difference density plot (calculated as  $\rho[3I/\sigma] - \rho[\text{no } I/\sigma]$ ) of the Synergy Ag dataset showing the difference when using no  $I/\sigma$  cutoff, and a  $I > 3\sigma$  intensity cutoff. The black dotted line in the difference density plot is zero, red and blue lines are positive and negative features, respectively. Contours are shown at  $0.01 \text{ e}/\text{\AA}^3$  intervals.

The changes in multipole parameters and the derived electron density when using different  $I/\sigma$  cutoffs are negligible and significantly smaller than the differences between datasets, as exemplified by the quadrupole populations in Figure S2. We use a  $I > 3\sigma$  intensity cutoff in this study to only include the most reliable reflections.

**Test for  $3\lambda$  contamination:**

**Figure S3.** Difference between observed and calculated squared structure factors for reflections with  $3h3k3l$  indices shown as a function of the corresponding  $hkl$  for A) Stadivari, B) Supernova, C) Synergy Ag and D) Synergy Mo. The structure factor files for all conventional datasets have been tested for  $3\lambda$  contribution as described in (Krause *et al.*, 2015) and only a slight contamination for the Supernova data was found. The modern diffractometers seem to be much less affected. Consequently, as the source setup is very similar to the ones studied in the publication, we propose the single photon counting operation of the employed detectors (EIGER2 and HyPix) to more efficiently suppress the impact of the high energy photons.

## Bader charges:

Bader charges of each atom in units of e.

|      | SPring8 | Stadivari | Supernova | Synergy_Ag | Synergy_Mo |
