## Two new POMs-based compounds modified by lanthanide Schiff base complexes with interesting NLO properties

## S1. The third-order nonlinear optics

The electronic spectra of compounds $\mathbf{1 - 2}$ in DMF at a concentration of $1.0 \times 10^{-4} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$ give the nonliner absorption at room temperature. Two-photon absorption (TPA) values containing TPA coefficient $\beta$ and TPA cross section $\sigma$ were measured by the open-aperture Z-scan technique with femtosecond laser pulse and Ti:95 sapphire system. Figures 5 and 6 show the open aperture Z-scan curves of compound 1-2. The black dots are the experimental data, and the red lines represent the theoretical simulated curves modified by the following equations (eqn (1) and (2)):
$T(z, s=1)=\sum_{m=0}^{\infty} \frac{\left[-q_{0}(z)\right]^{m}}{(m+1)^{3 / 2}} \quad$ for $\left|q_{0}\right|<1$
$q_{0}(z)=\frac{\beta I_{0} L_{e f f}}{1+z^{2} / z_{0}{ }^{2}}$
where $\beta$ is the TPA coefficient of the solution, $I_{0}$ is the input intensity of laser beam at the focus $z=0$, $L_{\text {eff }}=\left(1-e^{-\alpha L}\right) / \alpha$ is the effective length with $\alpha$ and $L$ are the linear absorption coefficient and the sample length respectively. $Z$ is the sample position, $z_{0}=\pi \omega_{0}{ }^{2} / \lambda$ is the diffraction length of the beam, in which the $\omega_{0}$ and $\lambda$ are the spot size at the focus and the wavelength of the beam respectively. Furthermore, the molecular TPA cross section $\sigma$ can be calculated by the following relationship:
$\sigma N_{A} d \times 10^{-3}=h v \beta$
where $N_{A}, d, h$ and $v$ are respectively the Avogadro's constant, the concentration of the compound, the Planck's constant and the frequency of input intensity.

Table S1 The third-order NLO data of complexes 1-2.

| Compounds | $\beta^{\mathrm{a}}\left(\mathrm{cm} \cdot \mathrm{GM}^{-1}\right)$ | $\mathrm{\sigma}^{\mathrm{b}}\left(\mathrm{GM}^{\mathrm{c}}\right)$ | $\lambda(\mathrm{nm})$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | 0.05352 | 2264 | 700 |
| $\mathbf{2}$ | 0.30330 | 941 | 820 |

[^0]${ }^{c} 1 \mathrm{GM}=10^{-50} \mathrm{~cm}^{4}$ s per photon.

S2. Characterization

Figure S1 The TGA curve for $\mathbf{1}$ and $\mathbf{2}$.

Figure S2 The TGA curve for 1.

Figure S3 The TGA curve for 2.

Figure S4 The IR spectrum of $\mathbf{1}$.

Figure S5 The IR spectrum of 2.

Figure S6 PXRD patterns of $\mathbf{1}$ (in ascending order): simulated, experimental, one year later in the sample vial under ambient conditions, and kept for 24 h in the constant temperature $\left(100^{\circ} \mathrm{C}\right)$ of oven.

Figure S7 PXRD patterns of $\mathbf{2}$ (in ascending order): simulated, experimental, one year later in the sample vial under ambient conditions, and kept for 24 h in the constant temperature ( $100^{\circ} \mathrm{C}$ ) of oven.

## S3. Electrochemical properties

Table S2 The mean peak potentials $\mathrm{E}_{1 / 2}$ of 1-CPE, 2-CPE and 3-CPE.

| CPE | The mean peak potentials $\mathrm{E}_{1 / 2}\left(\mathrm{mV}, 200 \mathrm{mV} \mathrm{s}^{-1}\right)$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{I}-\mathrm{I}^{\prime}$ | III-II' III | IV-IV' |  |
| 1-CPE | 440 | 257 | 41 | -134 |
| 2-CPE | 446 | 253 | 55 | -120 |
| 3-CPE | 414 | 281 | 43 | -122 |

[^0]:    ${ }^{\text {a }}$ the TPA absorption coefficient of the solution.
    ${ }^{\mathrm{b}}$ the molecular TPA cross-section.
