**Figure S1** EtLsc MST binding assay. The data have been collected in replicate and processed with MO.Affinity Analysis from NanoTemper.

**Figure S2** Structure identity comparison of bacterial LSCs and INUs. The tree was generated with DALI server and shows the Dali Z-scores. The structure similarity is represented by the branch length.

**Figure S3** Fructose binding mode of InuHj from *Halalkalicoccus jeotgali* B3T. InuHj substrates 1-Kestose (PDB ID 7BJ4, coloured in slate) and sucrose (PDB ID 7BJC, coloured in sand) compared to: (A) fructose from EaLsc (in green) as representative of Gram-negative binding mode; (B) sucrose from BsSacB (in orange) as representative of Gram-positive binding mode.
