Supporting information for article:

Visualization of protein crystals by high-energy phase-contrast X-ray imaging

Maxim Polikarpov, Gleb Bourenkov, Irina Snigireva, Anatoly Snigirev, Sophie Zimmerman, Krisztian Csanko, Sandor Brockhauser and Thomas Schneider

Figure S1 Optical micrograph of the Siemens star taken with the on-axis viewing system on the MD3 diffractometer. Bars with the size of 500 nm are the last visible, thus defining the optical resolution.

Figure S2 Predicted intensity distributions as a function of distance for effective source sizes of 35 μm (in black) and 100 μm (in red) illustrating the influence of the assumed source size on the visibility of fringes. Calculations are made for the experimental conditions described in paragraph 3.1.
