

Immune response models tested

The different alternative models can be written as:

$$\text{Infectivity} \begin{cases} \frac{dT}{dt} = -\beta(1 - \phi T \frac{F}{F + \theta}) V_i T & (1a) \\ \frac{dI_1}{dt} = \beta(1 - \phi T \frac{F}{F + \theta}) V_i T - k I_1 & (1b) \end{cases}$$

$$\text{Cytotoxicity} \quad \frac{dI_2}{dt} = k I_1 - \delta I_2 - \phi I_2 \frac{F}{F + \theta} \quad (2)$$

$$\text{Viral production} \begin{cases} \frac{dV_{ni}}{dt} = p(1 - \phi \frac{F}{F + \theta})(1 - \mu) I_2 - c V_{ni} & (3a) \\ \frac{dV_i}{dt} = p(1 - \phi \frac{F}{F + \theta}) \mu I_2 - c V_i & (3b) \end{cases}$$

$$\text{Viral clearance} \begin{cases} \frac{dV_{ni}}{dt} = p(1 - \mu) I_2 - c V_{ni} - \phi V_{ni} \frac{F}{F + \theta} & (4a) \\ \frac{dV_i}{dt} = p \mu I_2 - c V_i - \phi V_i \frac{F}{F + \theta} & (4b) \end{cases}$$

$$\text{Other models tested} \begin{cases} \frac{dT}{dt} = -\beta V_i T & \text{if } \theta \text{ is set to } \infty & (5a) \\ \frac{dT}{dt} = -\beta V_i T - \phi T & \text{if } \theta \text{ is set to } 0 & (5b) \end{cases}$$
