^a associations estimated using a linear mixed model adjusting for age, sex, and relatedness in GEMMA^b phenotypes are natural log-transformed to reduce skewness^c phenotypes are raw metabolite concentrations, not percentages of total arsenic. Regressions are adjusted for total arsenic.^d phenotypes are latent variables obtained from principle components analysis (PCA) of all three metabolite percentages.^e PMI (primary methylation index) = MMA/iAs; SMI (secondary methylation index) = DMA/MMA^f number of participants with rs61735836 genotypes of CC, AC, AA were 1417, 231 and 12 respectively.
