

S2 Fig. Mental Health, Lockdowns, and Cases

Figure shows relative levels of unweighted depression index, national COVID-19 cases per-capita, and national policy stringency index, for each of our samples over time. All three series are standardized so that all values fall between 0 and 1. The black points and error bars show predicted values and 95% confidence intervals for the depression index. The blue solid line shows new daily COVID-19 cases per-capita. The red dashed line shows values of the COVID-19 policy stringency index.
