

S9 Fig. The effect of question order and treatment on the disagreement (range) of initial estimates in Experiment 2. Data are panelled by treatment (proportion of black sweets): 48/200 (A), 94/190 (B) and 121/160 (C). The box plots show the median (thick black lines), interquartile range (enclosed by the boxes), $1.5 \times$ the interquartile range beyond the boxes (whiskers) and outliers beyond the whiskers (open circles).
