^aThe types of arrhythmia identified in the population of this study included atrial fibrillation, supraventricular tachycardia, ventricular tachycardia, and ventricular fibrillation.

^bThe family history was considered positive when one of the first- or second-degree relatives was diagnosed with dilated cardiomyopathy, sudden unexplained cardiac death, or an unknown cause of congestive heart failure.

Abbreviations: M, male; F, female; Y, yes; N, no; LVEF, left ventricular ejection fraction; ND, not detected; VUS, variant of uncertain significance.
