In this study, we utilize $\text{ZnCl}_2/\text{AlCl}_3\text{-SiO}_2$ as a moderate, retrievable, cost-effective and available catalyst at room ambient temperature and in the solvent free in order to synthesize 1,4-dihydropyridine, which entails biological characteristics in Hantzsch reaction. This reaction is as a result of compression of three components, in the solvents free and high yield products and with high-efficiency and purity.

Key Words: Hantzsch reaction, Multi-component reaction, One-pot synthesis, Solvent free.

Di-hydropyridines have been recognized as the largest and most important calcium passage controllers¹⁻³. Research has expanded chemistry of di-hydropyridines. These compounds reduce blood pressure and also cause imbalance of coral and vessel cells. As a result, these compounds have the property of antiblood-pressure⁴⁻⁷. Other different medicines are utilized for treating forgetfulness, diabetes and also removing tumors⁸⁻¹⁰. The importance of di-hydropyridines is not only restricted to the medicine effects because they conduct important activities in some other live systems. Oxidation and reduction, which are crucial bio-processes, are examples in whose structures the di-hydropyridines act as the main core by virtue of enzymes¹¹⁻¹⁴.

Regarding the items presented in relation to green chemistry reactions, multi-component Hantzsch different medical properties of compounds with core of 1,4, di-hydropyridines, generalization and expansion of these reactions could be so important¹⁵⁻¹⁸. The design of molecules which are of importance economically or environmentally, is normally found in the series of these reactions¹⁹⁻²¹. One of the most important methods to synthesize derivatives of 1,4 di-hydropyridines, multi-component and single-stage compression of these compounds is by virtue of Hantesh reaction. Various catalysts have been applied for these types of reactions. Some of these reactions are so interesting in terms of chemical synthesis²²⁻²⁶. Most of the cited reactions are expensive, complex and not retrievable. Therefore, in this study a simple method has been proposed for three-component and single stage synthesis of derivatives of 1,4-dihydropyridines in the solvent free and at ambient temperature and with the presence of a new catalyst, $\text{ZnCl}_2/$

$\text{AlCl}_3\text{-SiO}_2$, which does not have the drawbacks of other catalysts.

Melting points were measured on the electrothermal 9100 apparatus and are uncorrected. IR spectra were measured on a Bomen FT-IR-MB 100 spectrometer. ¹H and ¹³C NMR spectra were measured with a Bruker DRX-300 avance spectrometer at 300 and 75. MHz using TMS as internal standard. Chemical shifts are reported (d) relative to TMS and coupling constant (J) is reported in hertz (Hz). Mass spectra were recorded on a Shimadzu QP 1100 EX mass spectrometer. Elemental analysis for C, H and N were performed using a heraus CHN rapid analyzer.

In order to synthesize the derivatives of 1,4-dihydropyridines in a corked test tube, 1 mmol of dimedon, 1 mmol ethyl acetoacetate or methyl acetoacetate, 1.2 mmol aluminium acetate, 1 mmol aromatic aldehyde and 0.2 mmol catalyst $\text{ZnCl}_2/\text{AlCl}_3\text{-SiO}_2$ are added and mixed for the required time and the progress of the experiment was followed by thin layer chromatography (TLC) (Tank solvent *n*-hexane and ethyl acetate with the ratio of 1:2). After completion of reaction, ethyl acetate was added to the obtained product for catalyst removal (**Scheme-I**). After heating the yielded product was filtered. In this way, after cooling the solution under the filter, the prospective product was re-crystallized with ethyl acetate.

Spectral data:

Methyl-1,4,5,6,7,8-hexahydro-2,7,7-trimethyl-4-(naphthalen-2-yl)-5-oxoquinoline-3-carboxylate (I): m.p. 280 °C, IR (KBr, ν_{max} , cm^{-1}): 3282 (NH); ¹H NMR (DMSO)

TABLE-1
 PHYSICAL CHARACTERISTIC DATA OF THE SYNTHESIZED 1,4-DIHYDROPYRIDINE DERIVATIVES

Entry	Ar	R	Products	Time (h)	Yield (%)	m.p. (°C)	Lit. m.p. (°C)
1	Ph	CH ₃ -CH ₂	a	3	95	189	190 ⁸

Scheme-I: Synthesis of 1,4-dihydropyridine derivatives *via* Hantzsch reaction by simple and efficient method under solvent free and room temperature condensations

δ_H : 0.80 (3H, s, CH₃), 0.99 (3H, s, CH₃), 2.07 (2H, dd, $J = 67.4$ Hz, $J = 15.8$ Hz, CH₂), 2.33 (3H, s, CH₃), 2.4 (2H, dd_{broad}, $J = 23.2$ Hz, CH₂), 3.51 (3H, s, OCH₃), 5.05 (H, s, CH), 7.37-7.80 (7H, m, Arom); ^{13}C NMR (DMSO, 300 MHz) δ_C : 18.84, 26.77, 29.62, 32.59, 36.45, 50.67, 51.17, 103.49, 110.28, 125.56, 125.64, 126.23, 127.06, 127.71, 127.89, 128.11, 132.10, 133.27, 145.34, 145.99, 150.16, 167.81, 194.89; MS (m/z , %): 375 (M^+).

Methyl-4-(3-chlorophenyl)-1,4,5,6,7,8-hexahydro-2,7,7-trimethyl-5-oxoquinoline-3-carboxylate (m): m.p. 220 °C, IR (KBr, ν_{max} , cm⁻¹): 3201 (NH), 1710 (CO), 1608 (CO broad); ^1H NMR (DMSO) δ_H : 0.82 (3H, s, CH₃), 0.99 (3H, s, CH₃), 2.08 (2H, dd, $J = 56.6$ Hz, $J = 16.1$ Hz, CH₂), 2.30 (3H, s, CH₃), 2.32 (2H, dd_{broad}, $J = 17.103$ Hz, CH₂), 3.52 (3H, s, OCH₃), 4.85 (H, s, CH), 7.08-7.25 (4H, m, Arom); ^{13}C NMR (DMSO) δ_C : 18.82, 26.75, 29.52, 32.63, 36.21, 50.55, 51.25, 102.98, 109.91, 126.24, 126.44, 127.54, 130.30, 132.87, 146.38, 150.22, 150.32, 167.57, 194.85; MS (m/z , %): 359 (M^+).

A simple and effective method for a three-component and one-pot 1,4-di-hydropyridines derivatives from concentrations of dimedon, aromatic aldehyde, ethyle aceto acetate or methle aceto acetate and ammonium acetate in presence of low amount of ZnCl₂/AlCl₃-SiO₂ catalyst in conditions without solvent and ambient temperature is used. The physical characteristic data of the synthesized 1,4-dihydropyridine derivatives are given in Table-1. A new catalyst is used that omit the disadvantages of several other catalysts such as complexity, high costs, toxicity and no recoverability. Several similar reactions are done in toxic solvents whereas in this project the reaction is done in the absence of solvent.
