Various pyrazole acrylic acid derivatives were obtained by the Knoevenagel condensation of pyrazole-4-carbaldehydes with 'active methylene' compounds. In the condensation reaction with malonic acid and cyanoacetic acid, decarboxylation of the resulting acids was not observed. The products were characterized through spectroscopic techniques and elemental analysis.

Key Words: Pyrazoles, Knoevenagel condensation, Pyrazole-4-carbaldehydes.

INTRODUCTION

Knoevenagel condensation¹ is a very effective way of extending carbon chains and often exploited for the purpose. Pyrazole chemistry has afforded some interesting biological materials; one of these is COX-2 inhibitor *i.e.*, celecoxib² (a), already in clinical use, other is a well known agrochemical *i.e.*, furamptyr³ (b), used as a fungicide. In anotherazole researches such as with pyrrole some interesting pyrrole-3-acetic acid derivatives are being explored as NSAIDs⁴. Similar acid derivatives could easily be obtained from pyrazole-4-carbaldehydes.

(a) Celecoxib

(b) Furamptyr

Fig. 1. Important pyrazole containing biological compounds

An appropriate pyrazolecarbaldehyde through Knoevenagel condensation could provide such a scaffold for posterior manipulation. Pyrazole-4-carbaldehydes are readily obtainable from various reactions such as: by the Rosenmund reduction of pyrazole-4-carbonyl chloride^{5a,b}, by the Sommelet reaction of the corresponding 4-chloromethylpyrazole^{5c}, by the Vilsmeier-Haack reaction of pyrazoles⁶⁻⁹ or by the reaction of appropriate semicarbazones or hydrazones with Vilsmeier reagent^{10,11}. Recently, a review on 1,3-diarylpyrazol-4-carbaldehyde has appeared in literature¹². Some of these aldehydes have previously been condensed with various substrates such as acetophenones^{7,13}, 4-acetylpyrazole¹⁴, pyruvic acid¹⁵, hippuric acid¹⁶, malonic acid^{7,17}, indole-3-acetonitrile¹⁸ and benzopyrillium salts¹⁹.

These considerations prompt us to continue our work on pyrazole chemistry and we have already reported some of our work on pyrazole derivatives²⁰. Now we would like to present our results of Knoevenagel condensations of some pyrazole-4-carbaldehydes.

EXPERIMENTAL

All the chemicals were purchased from Aldrich and used without further purification. The ¹H NMR spectra were taken on a Hitachi Perkin-Elmer spectrometer model R-20B operating at 60MHz (tetramethylsilane as internal reference). The IR absorption spectra were recorded as potassium bromide discs on a Perkin-Elmer model 180 spectrophotometer. Elemental

analysis was carried out on a Perkin-Elmer model 240. Melting points were obtained on a Fisher-Johns apparatus and are uncorrected.

Pyrazole-4-carbaldehydes: The following starting materials were prepared according to the literature methods: 1-Phenylpyrazole-4-carbaldehyde²¹ (**1**): m.p. 76-78 °C, yield 85 %. 1-*p*-Methoxyphenylpyrazole-4-carbaldehyde²² (**2**): m.p. 83-84 °C, yield 89 %. 3-Phenylpyrazole-4-carbaldehyde¹¹ (**3**): m.p. 128-129 °C, yield 87 %. 1-*p*-Nitrophenylpyrazole-4-carbaldehyde²³ (**4**): m.p. 167-168 °C, yield 78 %.

Knoevenagel condensations

General procedure: A mixture of 0.01 mol of the aldehyde, 0.01 mol of the "active methylene" compound, three drops of piperidine and five drops of pyridine in 10 mL of ethanol was heated under reflux for the required time as monitored by TLC. The reaction mixture was cooled and inverted over crushed ice, acidified with hydrochloric acid (pH 6), filtered, washed with cold water and dried. The dried precipitates were crystallized from an appropriate solvent. The following products (**Scheme-I**), were synthesized: 2-((1-Phenyl-1*H*-pyrazol-4-yl)methylene)malonic acid (**10**): m.p. 206-207 °C, yield 1.93 g; 75 %. 2-((1-(4-Methoxyphenyl)-1*H*-pyrazol-4-yl)methylene)malonic acid (**11**): m.p. 165-166 °C, yield 2.12 g; 74 %. 2-((3-Phenyl-1*H*-pyrazol-4-yl)methylene)malonic acid (**12**): m.p. 169 °C, yield 1.93 g; 75 %. 2-((1-(4-Nitrophenyl)-1*H*-pyrazol-4-yl)methylene)malonic acid (**13**): m.p. 204-206 °C, yield 2.02 g; 67 %. Diethyl 2-((1-phenyl-1*H*-pyrazol-4-yl)methylene)malonate (**14**)²⁴: m.p. 57-58 °C, yield 2.34 g; 75 %. Diethyl 2-((1-(4-methoxyphenyl)-1*H*-pyrazol-4-yl)methylene)malonate (**15**): m.p. 74-75 °C, yield 2.43 g; 71 %. Diethyl 2-((1-(4-nitrophenyl)-1*H*-pyrazol-4-yl)methylene)malonate (**16**): m.p. 128-129 °C, yield; 2.47 g; 69 %. (Z)-2-Phenyl-3-(1-phenyl-1*H*-pyrazol-4-yl)acrylonitrile (**17**): m.p. 121-122 °C, yield 1.63 g; 57 %. (Z)-3-(1-(4-Methoxyphenyl)-1*H*-pyrazol-4-yl)-2-phenylacrylonitrile (**18**): m.p. 169 °C, yield 2.14 g; 68 %. (Z)-3-(1-(4-Nitrophenyl)-1*H*-pyrazol-4-yl)-

Scheme-I

2-phenylacrylonitrile (**19**): m.p. 276-278 °C, yield 2.81 g; 85 %. (E)-Ethyl 2-cyano-3-(1-phenyl-1*H*-pyrazol-4-yl)acrylate (**20**): m.p. 132-133 °C, yield; 2.20 g; 83 %. (E)-Ethyl 2-cyano-3-(1-(4-methoxyphenyl)-1*H*-pyrazol-4-yl)acrylate (**21**): m.p. 151-152 °C, yield 0.88 g; 30 %. (E)-Ethyl 2-cyano-3-(3-phenyl-1*H*-pyrazol-4-yl)acrylate (**22**): m.p. 167-168 °C, yield 0.72 g; 27 %. (E)-Ethyl 2-cyano-3-(1-(4-nitrophenyl)-1*H*-pyrazol-4-yl)acrylate (**23**): m.p. 187-189 °C, yield 0.87 g; 28 %. (E)-2-Cyano-3-(1-phenyl-1*H*-pyrazol-4-yl)acrylic acid (**24**): m.p. 212-214 °C, yield 1.76 g; 74 %. (E)-2-Cyano-3-(1-(4-methoxyphenyl)-1*H*-pyrazol-4-yl)acrylic acid (**25**): m.p. 236-238 °C, yield 2.19 g; 82 %. (E)-2-Cyano-3-(3-phenyl-1*H*-pyrazol-4-yl)acrylic acid (**26**): m.p. 249 °C, yield; 1.99 g; 84 %. (E)-2-Cyano-3-(1-(4-nitrophenyl)-1*H*-pyrazol-4-yl)acrylic acid (**27**): m.p. 320-322 °C, yield; 2.26 g; 80 %. The results are presented in Tables 1 and 2.

RESULTS AND DISCUSSION

We had already reported the synthesis of various pyrazole-4-carbaldehydes and their derivatives²⁵. The results of the present Knoevenagel condensations between the pyrazole-4-carboxaldehydes and the "active methylene" compounds are presented in **Scheme-I**. A mixture of pyridine and piperidine was used in these condensations¹. The reactions were carried out in refluxing ethanol. The results are collected in Table-1. Table-2 contains the spectral data for the compounds obtained

^aSee Scheme-1; ^ball strong bands; ^cnot very soluble in common NMR solvents.

during the reactions. As can be seen from the yields of the products (Table-1), the condensations worked well with the carbaldehydes studied. The following "active methylene" compounds were used: malonic acid, diethyl malonate, phenylacetone, ethyl cyanoacetate and cyanoacetic acid. For the compounds (**21-23**) obtained during these reactions

the yields were low but can be improved by increasing the reaction time as was the case with compounds (**17-19** and **24-27**).

The Knoevenagel reaction when carried out between an aldehyde and malonic acid or cyanoacetic acid in the presence of pyridine-piperidine catalyst at water bath temperature usually leads to the corresponding acrylic acid or acrylonitrile,

respectively by undergoing decarboxylation during the reaction. The non-decarboxylated products in the earlier reported reactions have been isolated by conducting the reactions at room temperature and with ammonia as catalyst¹. However, in our present work, we found that the reactions carried out with these pyrazole-4-carbaldehydes with pyridine-piperidine catalyst in refluxing ethanol also gave the non-decarboxylated products (**10-13** and **24-27**) in good yields. No decarboxylated products were isolated from these reactions. All isolated products were well characterized through their Infrared absorption (IR) and proton magnetic resonance spectra (NMR) were consistent with the structures (Table-2).

It may be noted that some recent publications deal with the Knoevenagel reaction of pyrazole-4-carbaldehydes with malonic acid under microwave irradiation giving the corresponding acrylic acids²⁶.

IR spectra: With the help of IR spectra (Table-2) it was easy to confirm the presence of carboxylic group in products. There were two carbonyl peaks appearing in between 1730-1675 cm⁻¹ in case of dicarboxylated compounds and a broad peak at 3000-2500 cm⁻¹ for -OH group. This points out that no decarboxylation has taken place during the condensation and pointing to the structures as (**10-13** and **24-27**). For -NO₂ group containing compounds two bands appeared in the region of 1545-1495 cm⁻¹ (asymmetric stretching) and 1350-1310 cm⁻¹ (symmetric stretching).

¹H NMR spectra: The PMR spectra were very helpful in elucidating structures of the products of condensation and readily confirmed the absence of decarboxylation during the reaction. The PMR spectra showed a singlet between 8.10 and 9.25 due to a single vinyl proton instead of two doublets expected for the two vinyl protons in case a decarboxylation would have occurred. All the products (**10-13** and **24-27**) displayed this feature. Other signals due to the remaining groups, aryl and pyrazole protons were also easily identified²⁷ (Table-2).

Conclusion

Knoevenagel condensation of pyrazole-4-carbaldehydes and various "active methylene" compounds using pyridine and piperidine as base in refluxing ethanol were studied during this research work (**Scheme-I**). In the present study condensations with malonic acid or cyanoacetic acid did not accompany decarboxylations and the expected products retaining the carboxylic groups were isolated. IR, ¹H NMR and elemental analysis helped in characterizing these products. In some cases yields are improved by increasing reaction times.

ACKNOWLEDGEMENTS

The authors thank HEC for indigenous scholarships to Faryal Chaudhry, Nadia Asif, Muhammad Nasrullah and Qura Tul Ain. Cel. Jorge Ribeiro indebted to the Ministerio de Exercito, Brazil for study leave.
