Abstract

Stress is a dynamic condition in which an individual is confronted with an opportunity, constraint, or demand related to what he or she desires, and for which the outcome is perceived to be both uncertain and important. Stress has become buzzword and legitimate concern of times. During the past decade, the banking sector has undergone rapid policy changes due to globalization, liberalization and privatization which led to increase in competition and introduction of new technologies. Stress among bank employees has increased manifold due to turbulent environmental changes. Stress can manifest itself in both a positive and a negative way. It can be caused by number of factors called stressors. Factors that create stress can be grouped into two major categories— Organizational and Personal factors. Both directly affect employees and ultimate their job. Hence it becomes imperative to have effective measures to reduce the stress level. This study analyzed the organizational and individual factors which can be a root cause of stress for an employee. An attempt has also been made to study the association between various demographic factors of employees and their stress level. Chi-square test was applied to study the association between stress level and demographic factors. Garrett's ranking technique was also used to rank the factors which caused stress among the employees and the initiatives for managing stress.

Keywords: Stress, Public Sector, Bank Employee, Stressors, Initiatives

INTRODUCTION

Workplace stress is becoming a major issue in all types of organizations. It is now a matter of concern for both the employees and the organization. Work-place stress has, in fact, become a part of life for the employees. It is a carry-over to home and affects all relationships. Today life has become very complex even at home. It crosses home boundaries and like a shadow follows the employees outside home. It is impossible to avoid stress; it has to be managed. Stephen Robbins (1999) defines stress as “a dynamic activity wherein an individual is confronted with an opportunity, constraint or demand related to what he or she desires, and for which the outcome is perceived to be both uncertain and important”.

Stress, in general, is an unavoidable consequence of modern living which has been, and is being continuously, affected by advancements in science and technology. We live practically in knowledgeable society, full of new challenges, opportunities and vicissitudes. All concerned know it well that past decades have witnessed tremendous changes at work-places owing to changes in organizational structure, policies and practices, peer pressures and consumer

behaviour. There are other reasons too for stress generation like growth of industries, not only in the urban areas but also in the rural areas causing heavy pressure on the facilities and other infrastructure; quantitative growth in population and various problems in day-to-day life are also other reasons for increasing stress. There is accordingly dire need to attain and sustain the most healthy work environment because of the pervasiveness of stress in all aspects of work.

Stress is defined generally as the non-specific response of the body to any demand, whether it is caused by, or results in, pleasant or unpleasant conditions (Selye, 1936). A recent global economic indicator survey conducted by the Regus Group revealed significant increase of work-related stress over the last two years in most of the countries. The highest increase was recorded in China where about 86% employees reported a rise in stress. India too ranked quite high, as 57% of its workers said they experienced a higher level of stress (WHO, 2006). Job related stress is triggered by two groups of sources - organizational and individual. The figure below depicts a model of managerial job stress. It contains depiction of main sources/causes of stress.

(INSERT FIGURE 1 HERE)

**Research Scholar, Department of Applied Sciences, PEC University of Technology, Chandigarh.

It is reiterated that stress has become a major cause of concern for both employers and employees. Symptoms of stress are manifested both physiologically and psychologically. Persistent stress can result in cardiovascular disease, sexual health problems, a weaker immune system and frequent headache, stiff muscles, or backache, etc. Table I indicates that out of top ten causes of death in India, maximum deaths are stress related.

(INSERT TABLE 1 HERE)

Another study conducted by ASSOCHAM (Associated Chambers of Commerce and Industry in India) and PWC (Price Waterhouse Coopers) reveals that 65 million people were affected by hypertension in 2008 and the number was likely to increase to 200 million by 2015. It is estimated that India is losing its potentially productive years due to increasing heart diseases and strokes in the age group of 35-60 years, falling in the group of countries that comprise the ones with the highest incidence in the world (K. Aswathapa, 2009).

It is necessary to understand the types of physical and psychological stress factors in the internal and external work environment and the level of their interaction with individual's characteristics so that interventions may be made for the reduction of their impact, if not elimination thereof altogether, from the work place, thus ensuring greater efficiency and optimum productivity and also enhanced well being of employees within their families and with the outside world.

LITERATURE REVIEW

Stress is a condition of strain that has a direct bearing on emotions, thought process and physical conditions of a person (Jayashree, 1992, P34). Seventy five percent of body diseases are said to be stress related (R. Ganpathi, 2010, P48).

Steers (1981) indicates that, "occupational stress has become an important topic for study of the organizational behaviour for several reasons".

- Stress has harmful psychological and physiological effects on employees.
- Stress is a major cause of increased employee-turnover and higher rate of absenteeism.
- Stress experienced by one employee can affect the morale and safety of other employees.

Stress is understood to be the measure of the extent of adaptation of our body and mind to change. In other words,

stress represents an unbalanced state between environmental requirements and individual abilities for adaptation (Elkahlout & Algaed, 2009, P77). Change process occurring in an organization directly affects employee-prosperity as it has direct relationship with increased insecurity. This, in turn, results in enhanced feelings of stress; decreases job satisfaction and have negative implications on physical and psychological health among employees of an organization (Cunha and Cooper, 2002).

BANKING SECTOR

Since 1990s, the banking sector has undergone rapid policy changes due to privatisation, liberalization and globalization of the Indian economy which led to increase in competition by permitting entry of domestic private sector banks and foreign banks, introduction of new technologies in operations (like Core Banking Solutions) and many others – Internet Banking, installation of Automated Teller Machines (ATMs), Real Time Gross Settlement System (RTGSS). When we consider the amount of time employees spend in workplace, it is natural that occupational stress would pose serious threat to employee well-being. Status of financial security, opportunities for career advancement, demands and expectations to perform, relationships, events, and physical environment at workplace, continuously affect an individual's ability to cope in the work environment (Khattak & Khan, 2009, p.810). The invasion of technological revolution in all walks of life coupled with globalisation, and privatisation policies has drastically changed conventional patterns in all sectors and sub-sectors of the economy; the change is discernible in social and cultural domains too. The banking sector is no exemption to this. Globalization and privatization led policies compelled the banking sector to reform and adjust to have a competitive edge vis-a-vis private entities. These significant changes have both directly and indirectly affected the social, economic and psychological spheres of the bank employees (Khattak & Khan, 2009, p.11). It has been found that more than 60% of the bank employees have one or other problem directly or indirectly related to these drastic changes. The shattering consequences of stress can affect an individual as also an organization in different ways. The following table explains this:

(INSERT TABLE 2 HERE)

The factors discussed above are prospective attributes to cause occupational stress and related disorders among the employees. It has to be understood that, health is not merely the absence of disease or infirmity but a positive state of

complete physical, social and mental well being (M. Dhanalakshmi, 2011, P41). In this context, the researcher has undertaken this study to identify the major causes of stress.

OBJECTIVES AND METHODOLOGY

The objectives for the present study are as under:

1. To study the relationship between stress level and selected demographic characteristics (age, gender and monthly income).
2. To identify and analyze the organizational and individual factors leading to stress.
3. To suggest suitable measures for reducing the stress level among respondents.

The primary data for analysis has been collected from the employees of three public sector banks (Panjab National Bank, Canara Bank and State Bank of India) in Panchkula. To collect the primary data, 100 employees were selected with the help of convenience sampling. The data for analysis was collected using the tool of questionnaire. The questionnaire contained questions relating to organizational factors (unpleasant working conditions, time pressure, technological advancements, work overload, commands of boss, impatient and demanding customers and low salary). Individual factors (feeling of inequality, lack of peer support, health issues and family problems) leading to stress among employees as well as initiatives for managing stress.

The primary data collected has been analysed with respect to three age categories that is, category A₁ (below 25 years), A₂ (25-35 years) & A₃ (above 35 years) and three income categories viz; I₁ (below Rs. 20,000), I₂ (Rs. 20,000-30,000) and I₃ (above Rs. 30,000). Gender is another variable for the analysis of collected data. The observations during the collection of data have also been taken into consideration. Statistical tools used for analysis are simple frequencies, percentages and rating techniques. Chi-square test was applied to study the association between the stress level and selected demographic variables. Garrett's ranking technique was also used to rank the factors which caused stress among the employees and the initiatives for managing stress.

RESEARCH HYPOTHESIS

H₀: There is no relationship between the stress level of the respondents and selected demographic variables (age, gender and monthly income).

ANALYSIS

The results from the analysis of the collected data are presented under different heads.

(INSERT TABLE 3 HERE)

It can be inferred from the above table that the majority of respondents (63.79%) who felt stressed belong to age category A₂. But, the results of chi-square test show that there is no significant difference, at 5 per cent level of significance among the respondents belonging to different age categories as calculated value of chi-square is less than the table value.

(INSERT TABLE 4 HERE)

The chi-square value at 5 percent level of significance indicates that significant differences exist among the table 4 respondents belonging to different income categories in relation to stress level. It indicates that less income is one of the factors causing stress as maximum number of stressed employees belongs to low income categories viz; I₁ and I₂.

(INSERT TABLE 5 HERE)

Table 5 shows that out of stressed employees which account for 70%, maximum out of them are male employees (64.28) but chi square value reveals no association between the two attributes namely gender of the employees and their stress level, as the calculated chi square value is less than the table value. It means that employees experience stress irrespective of their gender.

ORGANIZATIONAL FACTORS CAUSING STRESS

The employees experience stress due to various organizational factors like poor working conditions, excessive work, time pressure to name a few. These can result in irritability, jumpiness, insecurity, exhaustion, and difficulty in concentrating. From the organizational point of view, stress also affects the overall productivity of the organization. Table 5 indicates the organizational factors causing stress among employees. To ascertain the major causes of stress, employees were asked to express their views on 5 point Likert Scale and their responses are shown below.

(INSERT TABLE 6 HERE)

Table 6 exhibits that majority of the respondents considered orders and commands of boss (67%), low salary (59%) and

work overload (56%) as main factors of stress. Majority of the respondents are either indifferent or neutral with respect to time pressure (50%), unpleasant working conditions (48%) and impatient customers (40%). Despite this position, many employees have shown their disagreement with technological advancements (32%) as one of the major organizational factors which causes stress.

INDIVIDUAL FACTORS CAUSING STRESS

The stress is caused not only by organizational factors but also by the personal (individual's) factors which are responsible for causing stress among employees. Contrary to organizational factors which are generalized in nature, individual factors are personal to employees and more specific thus sharply identifiable. During collection of data, it has been observed that if the employees felt that their efforts were not being recognized, and they were not getting fair treatment, a feeling of low self-confidence arises thereby which jeopardizes their efficiency, causing stress.

(INSERT TABLE 7 HERE)

Table 7 shows that various individual factors affect employee's performance and thereby cause stress. It shows that maximum respondents attribute feeling of inequality (60%) and family problems (53%) to their stress related issues. A large number of employees are neutral with respect to individual factors like lack of peer support (45%) and health issues (40%).

MAJOR CAUSES OF STRESS

Stress is a reality of our everyday life. There are both eustresses and distresses that come from our work and non-work lives. The work and non-work domains of one's life are closely interrelated. If one experiences much distress at work, that stress will be carried over to the home, which will increase the sense of awareness of even small distresses experienced in a family sphere. Likewise, stress experienced at home or with friends or from other non-work situations is carried over to the work place which generally heightens and multiplies the stresses experienced at work. Thus, in order to rank the most influencing reason for the job stress of the sample respondents, Garrett's Ranking Technique was used. Eleven selected factors are listed in table 8 to identify which factor is the root cause of stress. The order of merit thus given by the respondents for the 11 specific problems was converted into ranks by using the formula. The mean scores for all the problems were arranged in ascending order and ranks were shown in order of importance in table 8.

(INSERT TABLE 8 HERE)

Table 8 depicts the mean scores of various factors. Further, the table reveals that out of 11 factors listed above, work overload has been considered as the main cause of stress (59.59%) followed by time pressure (58.34%), unpleasant working conditions (58.23%), orders and commands of boss (52.33%) and so on. On the basis of Garrett's ranking analysis, impatient customers (42.13%) and lack of peer support (39.32%) causes minimum stress.

INITIATIVES FOR MANAGING THE STRESS LEVEL

The responsibility to maintain a healthy work-life balance rests on both, the organization and employees. The organization needs to support its employees by creating an environment that enables them to maintain a healthy balance. The employees, on the other hand, need an attitudinal shift and a mental discipline to ensure that priorities are set right and adhered to.

Taking close look by looking at stress from organizational point of view, management may not be concerned about the low to moderate levels of stress experienced by the employees. For this kind of indifference, the laudable reason is that some functional level of stress is necessary to improve employee performance. Such stress leads to crisis and then all faculties and generic skills come to assist the employee to look for workable alternatives thus promoting entrepreneurial innovation and creativity. But high levels of stress and sustained low levels of stress are a cause of concern for the management. It is at this stage that management rises to combat this stress for happy environment. A happy and satisfied employee improves his working and that performance is reflected in productivity and fewer faults in products. In a situation when stress overpowers the employees, the organizations should focus on diagnosing the causes of what actually manifests as symptoms causing stressful condition affecting health and application to work/task in the organization, and then try to rectify the problems from its origin. Unrealistic targets, poor communication and negative motivation are some of the root causes which should be avoided.

(INSERT TABLE 9 HERE)

Table 9 depicts that recognition and rewards got first rank with mean score of 66.40 followed by transparency in system and developmental programs with mean scores of 59.58 and 44.63, respectively. Stress is also caused when

employees find it tough to balance their professional and personal life. Therefore, the organisation (Bank in this study) can also take initiatives for managing both work and life and thereby manage stress.

FINDINGS AND SUGGESTIONS

As its objective, the study proceeded in systematic and scientific manner and analyzed the major causes of stress (organizational and individual) and also the initiatives that banks could undertake to reduce the stress level of employees. The results reveal that the potential sources of stress are heavy workload, dead-lines for various operational transactions (time pressure) and routine, boring and unpleasant working conditions. It is also inferred that there is a need on the part of the banks to look into these stress factors which may cause serious repercussions for the banking sector in the long run. The job of bankers demands continuous interaction with customers and figures. The staggering (prolonged) working hours also keep them off all the day long from their families and social life. These aspects lead to emotional exhaustion of banking sector employees and make them completely stressed out. It is important to note that there is significant relationship between income of employees and their stress levels but either age or gender has no significant association with employees being stressed or not.

The study suggests that the banks should conduct stress audit at all levels in the organization to identify stress areas and thus help to reduce stress. The system should be transparent and banks should encourage open channel of communication with employees. The study reveals that the employees should be duly recognized and rewarded for their good work which further improves their efficiency at work. The stress created by long hours can be reduced, if the banking transactions (operational work) are carried out in shifts. Lack of ample time for family and job worries at home leads to problems in work-family interface. Thus the study also recommends that the banks should introduce work life balance initiatives which will further motivate the employees and increase their productivity and quality at work.

CONCLUSION

Rising workplace stress is a large albatross hanging around the neck of both employees as well as employers. Developing a healthy workplace environment can pay off in reversing this trend. Inviting employees to have a say about their work environment in an honest and open fashion can

change the workplace culture and help reduce stress. Managing stress in growing economies like India has become quite a challenge as there is a mismatch between existing health infrastructure and the pace at which organizations are expanding. Therefore, it's high time we create awareness and adopt corrective measures to minimize the menace. The productivity of the work force is most decisive factor as far as the success of an organization is concerned. The productivity in turn is dependent on the psychological well being of the employees. In an age of highly dynamic and competitive world, man is exposed to all kind of stress factors that affect him on all realms of life. The growing importance of interventional strategies is felt more at organizational level.
