Table 1. Data for theaters.

The estimates for the populations of sites (which only include those in the settlement, not its hinterland), have been derived by multiplying the evidence for their inhabited areas by a series of population densities, while the seating capacities of each structure have been derived by measuring the total amount of space available for seating in each one, assuming a certain amount of space per person (0.28 m²). Note that these spaces do not include access and service areas (i.e., they have been reduced by 10%). For more information about how these figures have been calculated, please refer to the Inhabited Areas, Densities, and Numbers of Residents section and the Entertainment Structures section in the article. The residuals are a measure of how much each site deviates from the overall theater-population relationship. Aside from the civic statuses of sites, the table also shows the estimated populations of all known cities within a 40 km buffer of each site, the estimated total carrying capacities of the land within a same-sized buffer, and the distances between site and the nearest harbor or river. Finally, the table presents some additional information about the architectural design of each theater. Here, “R” denotes theaters with regular forms and “I” denotes those with irregular ones, while “Gk” indicates that a theater is Greek with Roman modifications and “Rn” that it is Roman. The last field simply states whether there is evidence that the orchestra could have also functioned as an arena.

Site	Estimated population of each site (persons)	Space available for seating in theaters (m ²)	Estimated seating capacity (persons)	Residuals	Civic status of site	Estimated population of neighboring cities (persons)	Total carrying capacity of surrounding land (calorific suitability index)	Distance to nearest harbor (km)	Distance to nearest river (km)	Form	Date	Converted into arena?

Table 2: Data for amphitheaters.

The estimates for the populations of sites (which only include those in the settlement, not its hinterland), have been derived by multiplying the evidence for their inhabited areas by a series of population densities, while the seating capacities of each structure has been derived by measuring the total amount of space available for seating in each one, assuming a certain amount of space per person (0.28 m²). Note that these spaces do not include access and service areas (i.e., they have been reduced by 10%). For more information about how these figures have been calculated, please refer to the Inhabited Areas, Densities, and Numbers of Residents section and the Entertainment Structures section in the article. The residuals are a measure of how much each site deviates from the overall theater-population relationship. Aside from the civic statuses of sites, the table also shows the estimated populations of all known cities within a 40 km buffer of each site, the estimated total carrying capacities of the land within a same-sized buffer, and the distances between site and the nearest harbor or river.

Site	Estimated population of each site (persons)	Space available for seating in amphitheaters (m ²)	Estimated seating capacity (persons)	Residuals	Civic status of site	Estimated population of neighboring cities (persons)	Total carrying capacity of surrounding land (calorific suitability index)	Distance to nearest harbor (km)	Distance to nearest river (km)
