Dedication

Ferran Hurtado passed away a few months after Eduardo Rivera-Campo and Rita Zuazua visited him and Mercè Mora in Barcelona, where most of this research was made. We all dedicate this final version to Ferran's memory.

Abstract

A set of vertices D of a graph G is a *distance 2-dominating* set of G if the distance between each vertex $u \in (V(G) - D)$ and D is at most two. Let $\gamma_2(G)$ denote the size of a smallest distance 2-dominating set of G . For any permutation π of the vertex set of G , the *prism of G with respect to π* is the graph πG obtained from G and a copy G' of G by joining $u \in V(G)$ with $v' \in V(G')$ if and only if $v' = \pi(u)$. If $\gamma_2(\pi G) = \gamma_2(G)$ for any permutation
