Abstract

A regular graph is co-edge regular if there exists a constant μ such that any two distinct and non-adjacent vertices have exactly μ common neighbors. In this paper, we show that for integers $s \geq 2$ and n large enough, any co-edge-regular graph which is cospectral with the s -clique extension of the triangular graph $T(n)$ is exactly the s -clique extension of the triangular graph $T(n)$.

Keywords: co-edge-regular graph, s -clique extension, triangular graph.

2010 Mathematics Subject Classification: 05C50, 05C75, 05C62.
