Mindboggle

Welcome to Mindboggle!

We are developing Mindboggle to improve the accuracy, precision, and reliability of automated labeling and shape analysis of human brain image data, and to promote open science by making all data, software, and documentation freely and openly available.

We are gearing up for our first official release!

Software

Please see the README for Mindboggle's open source, freely available python software for automated labeling, feature extraction, and shape analysis of human brain image data.

Data

Feel free to download Mindboggle-101 atlases, templates, and individual labeled brain image data, the largest collection of publicly available, manually labeled human brains in the world!

Mindboggle

Data

Welcome to the world's largest collection of free, manually labeled human brain image data!
Please cite the following article and this website when making use of Mindboggle-101 data:
101 labeled brain images and a consistent human cortical labeling protocol
Arno Klein, Jason Tourville. Frontiers in Brain Imaging Methods. 6:171. DOI: 10.3389/fnins.2012.00171

See the README, subjects table, scan info, labels, the CHANGELOG, and MD5SUMS,
which describe the labeled nifti volumes (nii), vtk surfaces (vtk), and FreeSurfer files (mgh, etc.).
Except where noted, all data are licensed under a Creative Commons License: (cc) BY-NC-SA

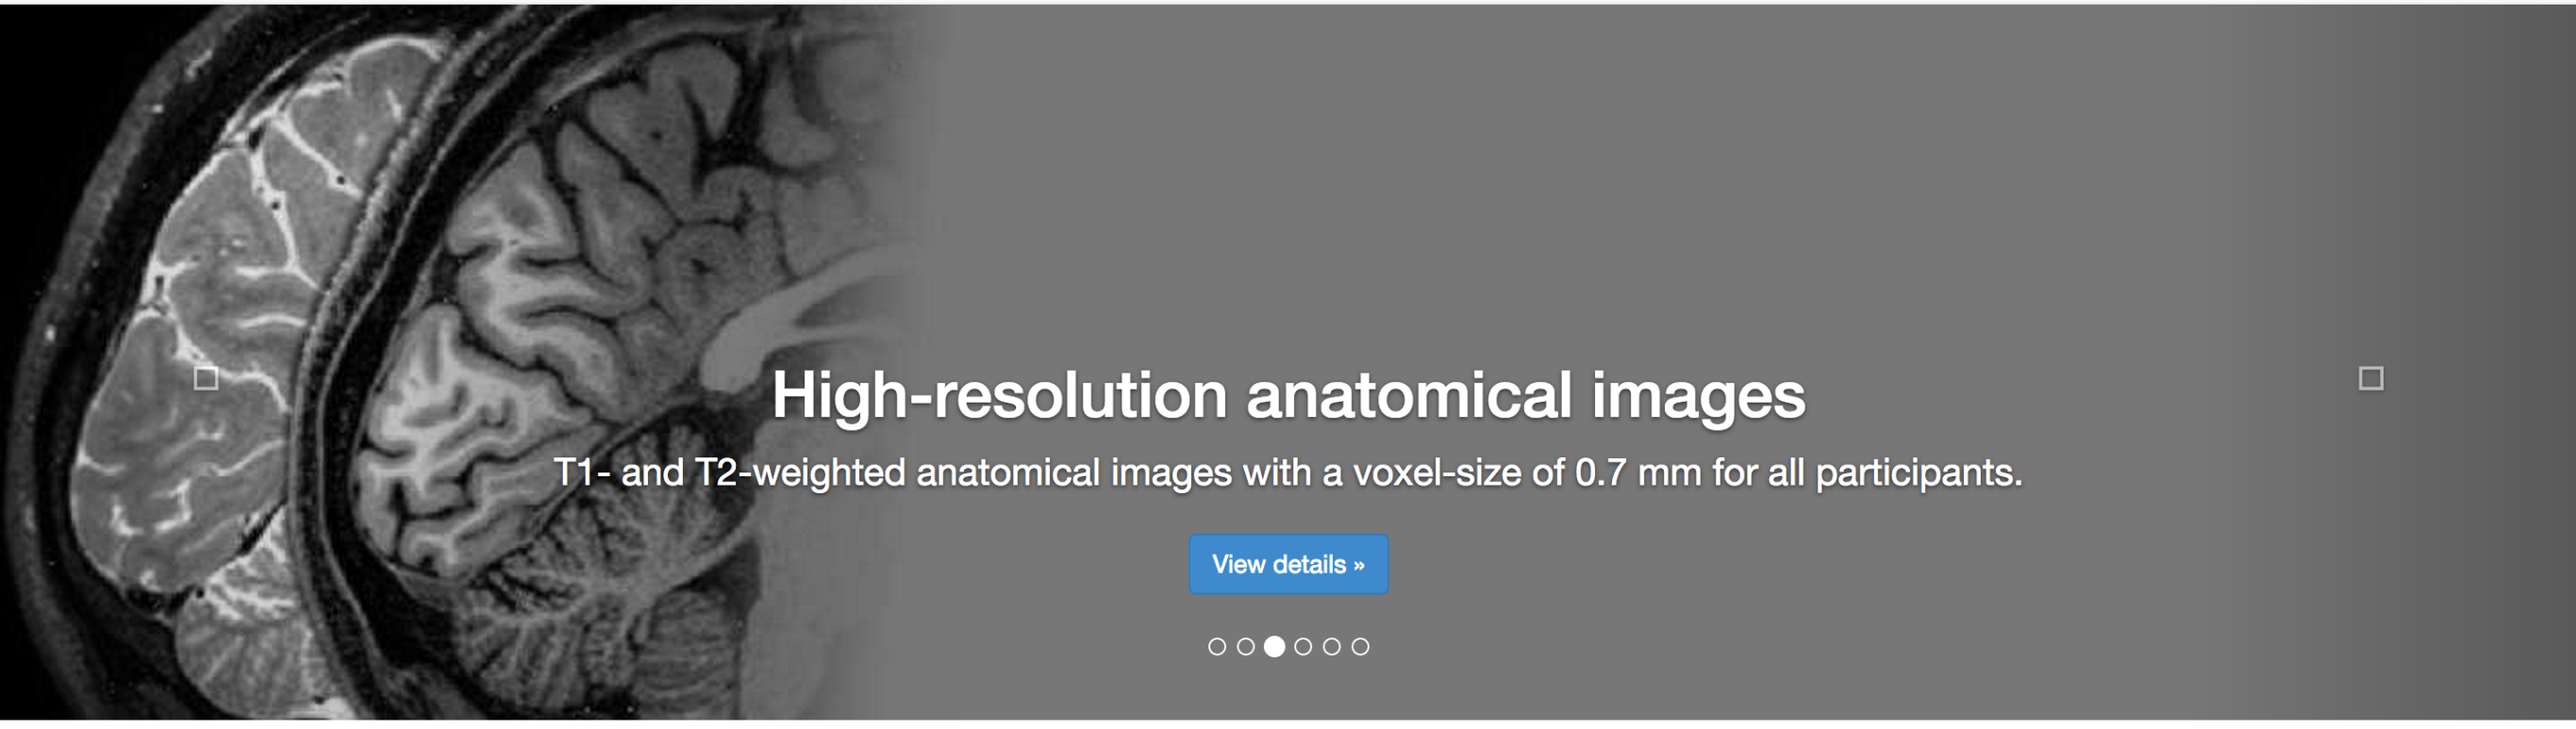
BRAIN PARCELLATION

Summary: Most connectivity-based clustering studies focus



The human brain is designed to process vast amounts of input that are continuously gathered through the senses. However, most experiments study the brain via simplified stimuli that do not resemble the complexity of a natural environment — a mismatch that needs to be addressed in order to better understand how the brain works. This project aims to provide essential components to enable inter-disciplinary research to study the brain's natural behavior and the versatile interactions of concurrent cognitive processes in everyday life.

Win 5000 Euro!

Challenge

Studying neural processing in real-life, rich natural environments requires adequate **data**, tested analysis **strategies**, and proven software **tools** that are capable deciphering brain activity pattern elicited by multiple concurrent neural processes.

Resources

We provide **extensive functional brain imaging data** from natural stimulation, a rich set of auxiliary data, (such as structural brain scans, measurements of physiological, and technical confounds), as well as stimulus annotations.

See overview »

Access

All data and software components are publicly available. There is no required sign-up or registration procedure. Data are released under an extremely permissive license and can be used by academic and commercial entities.

View instructions »

All Challenges

Here is an overview of all challenges that have been organized within the area of medical image analysis that we are aware of. If you know any study that would fit in this overview, please let us know by filling out this form.

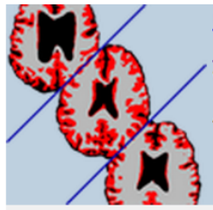
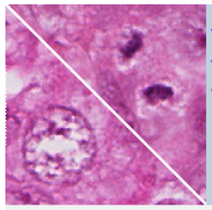
2014



Open for submissions
Data download
Workshop: Sep 18, 2014
Associated with: MICCAI 2014
Hosted on: grand-challenge.org

CADDementia

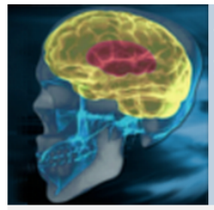
We seek algorithms that perform multi-class classification of patients with Alzheimer's disease (AD), patients with mild cognitive impairment (MCI) and healthy controls (CN) using multi-center structural MRI data.



Open for submissions
Data download
Associated with: ICPR 2014
Hosted on: grand-challenge.org

MITOS-ATYPIA-14

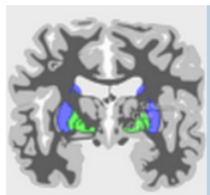
MITOS & ATYPIA 14 Contest, hosted by conference ICPR 2014 Detection of mitosis and evaluation of nuclear atypia on breast cancer H&E stained images



Open for submissions
Data download
Workshop: Sep 14, 2014

Brain Tumor Image Segmentation (BraTS 2014)

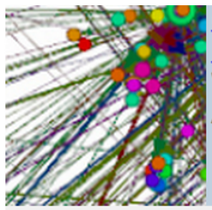
Contains three sub-challenges. 1: Segmentation of brain tumor (GBM) and its components, 2: Longitudinal Evaluation of time series image data and 3: Classification into Low- and and High Grade (GBM) gliomas.



Open for submissions
Data download
Associated with: STN 2014

Subthalamic Nucleus Segmentation Challenge 2014

This challenge seeks to bring together leading academic researchers to tackle the difficult problem of Subthalamic Nucleus (STN) segmentation in MRI volumes. Sponsored by Renishaw plc and organised by Aberytswyth University



Open for submissions
Data download
Workshop: Sep 14, 2014
Associated with: MICCAI 2014

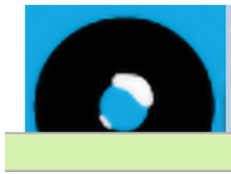
Brain Tumor Digital Pathology Challenge

Evaluation of classification of LGG and GBM, and segmentation of necrotic and normal brain regions from high-res digital pathology slide clinical cases.

Data download
Workshop: Sep 12, 2014
Associated with: ECCV 2014

Leaf Segmentation Challenge

To advance the state of the art in leaf segmentation and to demonstrate the difficulty of segmenting all leaves in an image of plants, we organize the Leaf Segmentation Challenge (LSC).



Open for submissions
Data download
Workshop: Sep 18, 2014
Associated with: MICCAI 2014

Alzheimer's Disease Big Data DREAM Challenge #1
Launch: June 2, 2014
Close: October 3, midnight Pacific Time

Join

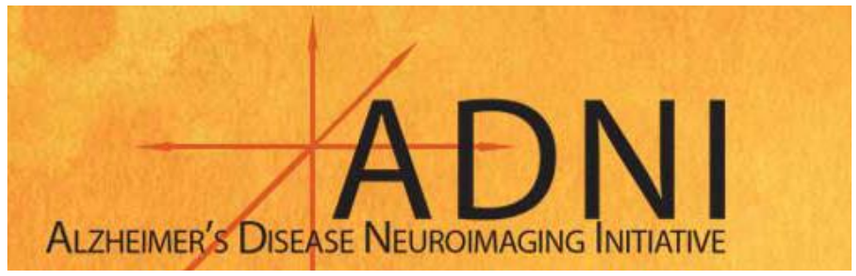
Classify individuals into diagnostic groups and predict MMSE cognitive score using MR imaging data

Scientific Rationale:

If a single MR image could be used to differentiate AD patients from people with mild cognitive impairment or from healthy individuals, research can focus on specific anatomical structures that are different between the groups.

Data

Training set



- MRI data
- Age
- Gender
- Years of education
- APOE4 genotype
- Whole genome imputed genotypes

INTERACT!

Incubator for New Tools for Education and Research in Autism -- Come Together!

INTERACT! is an incubator for developing free, open source apps and software tools that help children with Autism Spectrum Disorders (ASD) learn while also informing research into ASD. We invite parents of children with ASD, researchers, educators, software developers, and others interested in creating better ways to understand and manage ASD to contact INTERACT! for more information about joining the incubator.

Developers

Software developers who are the parents of children with ASD are welcome to apply for a 6-month sabbatical at Sage Bionetworks in Seattle. We will work with Researchers, Educators, and other developers on tools with maximal impact on children with ASD.

View details »

Researchers

Please email if interested in becoming an advisory board member.

Coming soon:

INTERACT! developers will build apps and tools for children with ASD to use. These apps will be designed to serve the dual purpose of helping children with ASD to learn in ways that work best for them and of enabling collection of the learning data from the app in real time to make it available for open research. We welcome feedback and collaboration with interested researchers.

Educators

Please email if interested in becoming an advisory board member.

Coming soon:

No one knows better than parents, caregivers, and educators about how to create the most effective learning environment for their children. Our collaborative, open endeavors will be guided by the wisdom and insights of those closest to children with ASD.

About this Study

Become a research partner! We believe in empowering individuals like you with the voice and the tools you need to manage your health, understand your disease, and contribute to research.

The Parkinson's Disease Mobile Study provides online tools that allow you to provide data and insights as research partners on the health problems that matter most to you and your family. By sharing data and experiences, you can contribute to new discoveries and better treatments. Learn more.

How this Study Works

Download the mobile app

The mobile app will help gather sensor data, freeing you up from having to entering lots of info.

Perform simple tasks

We'll ask you to do a few tasks and answer some questions about your health.

Track your health

You can use the health dashboard to track your health data.

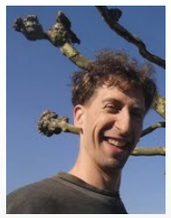
Scientists make discoveries

Scientists will use your data to make breakthroughs in medical research and treatments.

You learn the results

You'll have the opportunity to learn from the scientists about their research results.

Who is Running this Study



Arno Klein

Arno is excited about image processing and analysis, information visualization, 3-D display such as holography, and collaborative, open science. An example project he is actively leading is the Mindboggle software for brain image labeling, feature extraction, and shape analysis.
