Instructions for data and code of "Resource Windfalls, Political Regimes, and Political Stability", F. Caselli and A. Tesei, *The Review of Economics and Statistics*

This version. February 21^{th} 2015.

Prelims. First unzip the folder Data_Code_CT_Restat_2015 (required space 64 MB).

Data. All datasets are in Stata 13 format.

- The folder *"Data/output/final"* contains the final dataset called **"main_ct"** which is used for all regressions in the paper and in the Web Appendix.
- The folder *"Data/output/aux"* contains other output files used in the construction of the final dataset:
  - "aux1" contains the main dependent variables and the variables related to the principal commodity (price, share, etc.).
  - "aux2" adds the deviations from the sample-specific averages in autocracy and democracy in the different regressions, as well as the interaction terms used in the estimation of the heterogenous models.
  - "gpi" contains the general price indices at different base-years used in Table 8.
- The folder *"Data/source"* contains all the original data used in the construction of the final dataset:
  - "sitc1_raw" contains the SITC1 UN Comtrade data used in the identification of the principal commodity.
  - "polity_62_09" reports the Polity IV data.
  - "GDP_curr_usd_1962" contains the GDP in US$ used to calculate the share of each commodity.
  - "comm_index_princ" and "comm_index_gpi" report the indices of commodity market prices from the IMF International Financial Statistics.
  - "fh_pts_ciri" includes alternative measures of institutional quality used in Table A9.

- The folder *"Data/source/fut"* contains all futures data used in Table A5.

Do-files. The Stata do-files are available in the folder *"do"* . To replicate the results of the paper, change the directory in the do-file **"master"** and run it. The log files appear in the folder *"log"*. The results and the graphs in the main text and in the Web Appendix can also be obtained separately by running the corresponding do-files.
For information purposes, the do-files that were used to construct the final dataset from the raw data are also available in the folder *"do_construction"*:

- The do-file "makedata_ct" takes the raw data and construct the variables related to the main dependent and the principal commodity (generating the dataset "aux1").

- The do-file "variables_main" adds the deviations from the sample-specific averages in autocracy and democracy in the different regressions of the main text, as well as the corresponding interaction terms used in the estimation of the heterogenous models (generating the dataset "aux2").

- The do-file "variables_wapp" finally adds the deviations from the sample-specific averages in autocracy and democracy in the different regressions of the Web Appendix, and the corresponding interaction terms (generating the dataset "main_ct").

- The do-file "gpi" produces the general price indices at different base-years used in Table 8. (generating the dataset "gpi").

Excel files. The folder *"xls"* contains the file "Figure_2.xls", which plots the coefficients from column (3) of Table 1 and obtain the infra-marginal effect of resource windfalls at different initial levels of institutional quality, reported in Figure 2 of the main text.
