DE(13)

faint lams = 2-3 p/d

bioturbation?

480 — 1mm

90% msv. with 1-2 faint discont. <1mm th lam (burrowing animals destroyed lams)

1-2mm

well laminated -- lams 2 p/d

490

<1mm

predom. msv w/ possible burrows

faintly laminated

500

5mm

506

4-5mm

upper gcl for DE-13 Ld^3 Z Ag/As Z⁻ Dg^+

gcl

lower

5-10mm

508

455 dl detrital layer DE13

510

"porous" texture/structure like unit below DE12

2-3mm

55-510

well laminated lams = 2-3 p/d

Only reasonable explanation is that 96-25 & 96-24 were put in wrong vials in the core lab.

Note: no mlgc is this a bioturbated mlgc? Burrows here may have obliterated laminal.

upper: This unit is similar to lower part of gcl but more silt/clay Ld^3 Z Ag As Z

ARN 96-25 510 cm
10mm slice of ½ of core
4160 ± 65 BP 5.7 mg -34.2‰
AA-23211 4B,1H, I (B)

faintly laminated to msv.

520

prominent 2-3mm th. gcl

80% msv w/ faint 1mm th lams

530 BS3

TS4

75-80% msv with faint laminations

3mm

540

90% msv with indistinct lams.

5-10mm
