2-cm scale change ↓

as of 1/25/96: HK notes transferred (not AN notes)

NOTE: based on comparison to D, BB, E and F, the base of black soupy should be at about 25 cm; therefore all depths should be increased by 13 cm **

TS1 – new depth ≈ 20cm ← looks good from J.
Originally described 10/13/93

black soupy?

** approx base of black soupy, is now = 12, should be = 25
∴ add 13cm to all depths.

4/30/98 Description of 75-90cm looks fine. D1 is 23mm thick in right half and undisturbed with lots of horizontal Dh and some D1. Center 2/3 of mlgc is deformed by horizontal intrusion right below sand bed. There are 2 laminae below deformed zone & at least 25 above to J99. AMS stem must be reworked!
