Don't submit. Too much uncertainty in correlation.

1 mm, top of gcl

this gl is within (but near top of) gcl, as thin mlgc with a gl at base can be seen in core E.

sd Sand #1 202

Pulse # 1
96% sand, 4% silt + clay, 0.3% organic
sand = fine sand

0.5

eroded contact, it clearly truncates underlying laminae

zone of black-and-grey laminae each laminae is ~ 0.5-0.8 mm thick. Does the black material have charcoal frags? Why is the black associated with the grey? looks like another "black smear" or even an mlgc.

210

Possible burrowed mlgc??

1 mm

gcl? Ld3 As + Dg?

this is DE 5/6 - only evidence is the gcl (no sand, no mlgc, no assoc lake turnover)

220

3 mm
