Data File Information for "Counting the Pinocchios: The Effect of Summary Fact-Checking Data on Perceived Accuracy and Favorability of Politicians"

Replication materials for this paper include four items: three datasets containing data for the three separate studies (study1-replication.dta, study2-replication.dta, study3-replication.dta) and one Stata do-file that carries out analysis (replication-summary-fc.do). The statistical software used for this analysis is Stata (version 15). The do-file loads in each dataset, runs the necessary analyses, and produces output that fills the tables in the text. Each analysis in the do-file is commented with a name for the corresponding table in the paper. To conduct the replication, a user can set their working directory and run the do-file from start to finish.
