Replication Instructions for “Stable Income, Stable Family”

Jason M. Lindo

Krishna Regmi

Isaac D. Swensen

The README FILE describes datasets and programs used to produce figures and tables in this paper. Codes are produced using STATA MP version 16.1.

Data folder

The *data folder* contains two sub-folders: *outcome* and *source.* The *source* subfolder contains original data sets. Additionally, it includes various subfolders with each containing data from each source. You need to unzip the ZIP files. The *outcome folder* contains cleaned datasets.

Program folder

You need to change your directory in *_master dofile.* The *program folder* contains cleaning dofiles that start with the name “cl” and analysis dofiles that start with the name “Anly.” Re-creating analytical samples requires running all cleaning files from *cl_01_union* to *cl_29_final_wif.* (Executing *_master dofile* runs all the data cleaning programs.*)* Most of the analysis dofile names correspond to Table and Figure numbers in the manuscript. *Anlys_3_Main Husband* produces baselines tables and figures for the analytical samples of men and *Anlys_4_Main Wife* for the analytical samples of women. Codes in both of these dofiles report corresponding Table and Figure numbers. The *Anly_9_Roubstness checks* dofile presents codes used to produce estimates reported in footnotes.

Log folder

This folder will save log files.
