Index Data Availability Read Me

JP Morgan shared their index inclusion and weight data (two variables) for this research. Per our data licensing agreement with JP Morgan, this data was shared with the journal for replication purposes, but can only be shared with other researchers directly by JP Morgan.

Therefore, data on these two variables cannot made public in our repository for this article. Instead, researchers can obtain this data for free (and likely with the same restrictions) directly from JP Morgan by emailing index.research@jpmorgan.com.

Each table and corresponding figure in the article depends on these data. This means the article's tables and figures cannot be replicated without obtaining this data, appending it to our datasets, and then using the corresponding code. The dummy variable *Included* is created by coding whether an EM is included in EMBIG that year. The *IndexWeight* variable is the annual average of a country's weight in the index.

This means our paper is still fully replicable by any researcher that obtains JPM's historical index data. However, rather than downloading the raw index data directly from our Dataverse along with our other data, interested researchers must email index.research@jpmorgan.com to obtain EMBIG inclusion and weight data.

Please contact the authors if we can answer any additional questions.

Note: In a few robustness tests we also use bond price data obtained from JP Morgan, which is also subject to this agreement and redacted.
