Analysing termite favouritism in annular arenas*

20th September 2020

Compiled data and ran the analysis: Og DeSouza <og.souza@ufv.br>

Tracking algorithm:

Available at: https://github.com/dmrib/trackingtermites

Wrote the final code: Danilo Ribeiro

Wrote the first working code: Sidiney Alves

Supervised coding: Og DeSouza

1 Overall rationale

- Here we inspect whether termites walking in annular arenas would preferentially contact some of their nestmates over others along a *c.a.* 30 min period.
- To do so, we filmed and tracked each individual termite in the confined group, tallying the number of time-steps this focal termite spent contacting a given target termite along the whole footage.
- This has produced a dataset such as:

```
Tallyied time-steps for a group of 3 individuals.
-------------------------------------------------
  trajectory focalTermite targetTermite steps
1  traj00006    termite01     termite02   640
2  traj00006    termite01     termite03   676
3  traj00006    termite02     termite01   635
4  traj00006    termite02     termite03   500
5  traj00006    termite03     termite01   702
6  traj00006    termite03     termite02   502
-------------------------------------------------
```

*This is part of the paper: Paiva *et al.*(in review) Scale-free movement patterns in termites emerge from social interactions and preferential attachments. *submitted to PNAS*.

- then, for each individual we averaged number of time-steps it acted as a target of an interaction along the whole footage, producing a result such as:

```
Averaged time-steps a termite spent as a target.
------------------------------------------------
  targetTermite steps
1     termite01 668.5
2     termite02 571.0
3     termite03 588.0
------------------------------------------------
```

- then we ran a Chi-square test to verify whether the proportion of time-steps spent as a target would vary among termite individuals. That is to say, we inspected whether these proportions would depart from an uniform distribution and, if so, to point to the existence of 'favourite targets'.

- in case the Chi-square test did point to significant differences, we counted the number of 'favourites' within that given group. These 'favourites' were defined as as being the termites whose average number of time-steps spent as a target was larger than the global average of targeting time-steps in the whole footage.

- The number of preferred target-termites in each arena (y-var) was then regressed against the number of termites therein confined (x-var), in order to inspect how preferential attachments would correlate with group size. Analysis consisted in contrasting the model thereby obtained with a model with zero intercept and slope = 1, that is, a model in which favouritism was absent. Modelling was performed in R, under Generalised Linear Modelling and normal error distribution, followed by residual analysis. Contrasts were made using Akaike Information Criterion (AIC) (Fig. **??**b).

2 Loading and preparing data

```
> setwd("./")
> dt<-read.table("../dat/newdata.dat",sep=",") # termite1 changed to termite01, etc
> names(dt)[1] <- "trajectory"
> names(dt)[2]<- "focalTermite"
> names(dt)[3]<- "targetTermite"
> names(dt)[4]<- "steps"
> summary(dt)

     trajectory      focalTermite    targetTermite     steps
 traj00013:240    termite01: 67    termite01: 67   Min.   :   1.0
 traj00130:240    termite02: 67    termite02: 67   1st Qu.: 309.0
```

```
traj00007: 56    termite03: 67    termite03: 67   Median : 626.0
traj00100: 56    termite04: 63    termite04: 63   Mean   : 858.4
traj00145: 56    termite05: 51    termite05: 51   3rd Qu.:1032.0
traj00012: 12    termite06: 51    termite06: 51   Max.   :8963.0
(Other)  : 48   (Other)   :342   (Other)   :342
```

3 Preferences per trajectory

Preparing functions:

```
> interact <- function(traj){ # interactions with target termite
+   ss <- subset(dt,trajectory==traj)
+   ss <- droplevels(ss)
+   ##
+   ## the total number of steps here considers readings
+   ## from termite01 > termite02 as well as termite02 > termite01.
+   ## We should make it as the mean of both cases.
+   totSteps <- sum(ss$steps)
+   interactions <- aggregate(ss$steps,list(ss$targetTermite),mean)
+   names(interactions)[1] <- "targetTermite"
+   names(interactions)[2] <- "steps"
+   return(interactions)
+ }
> pl<-function(interactions)
+   {pval <- round(chisq.test(interactions[2])$p.value,4)
+   expected <- chisq.test(interactions[2])$expected
+   barplot(interactions$steps,
+         names.arg = interactions$targetTermite,
+         las=2,
+         main=paste(traj, " p = ",pval ),
+         ylab="time-steps",
+         ylim=c(0,1.1*max(interactions[2]))
+         )
+ abline(h=expected[1],col="red")
+ }
> summtraj <- function(resultChi){
+   expected <- resultChi$expected
+   observed <- resultChi$observed
+   favourites <- sum(observed>expected)
+   total <- length(resultChi$observed)
+   totSteps <- sum(resultChi$observed)
+   chi <- resultChi$statistic
+   pval <- resultChi$p.value
+   return(list(total = total,
+               favourites = favourites,
+               totSteps = totSteps,
+               chisquare = chi[[1]],
+               pvalue = pval))
+ }
>
```
