DOE/EIA-M065(2009)

MODEL DOCUMENTATION REPORT: MACROECONOMIC ACTIVITY MODULE (MAM) OF THE NATIONAL ENERGY MODELING SYSTEM

January2009

Office of Integrated Analysis and Forecasting
Energy Information Administration
U.S. Department of Energy
Washington, DC

Update Information

This edition of the *Macroeconomic Activity Model (MAM) – Model Documentation 2009* reflects changes made to the MAM over the past year for the *Annual Energy Outlook 2009*. These changes include:

- Addition of driver variables for the average price of light, sweet crude oil and for regional producer price indexes of coal, gas fuels, electric power, utility natural gas, refined petroleum products and residual petroleum fuels.
- Addition of the producer price indexes for metals and metal products and for finished producer goods to the global data structure.
- Updates to date ranges and programming code descriptions in the MAM source and input files.
- Updates to data for all the MAM models including factors used when assuming high or low economic growth or technology penetration.
- Re-specification and estimation of EIA's regional industrial output, employment by industry and commercial floorspace models.

Purpose of This Report

The National Energy Modeling System (NEMS) is a comprehensive, mid-term energy forecasting and policy analysis tool used by the EIA. The NEMS projects energy supply, demand, prices, and environmental emissions, by region, given assumptions about the state of the economy, international markets, and energy policies. The Macroeconomic Activity Module (MAM) links the NEMS to the rest of the economy by providing projections of economic driver variables for use by the supply, demand, and conversion modules of the NEMS. The MAM's baseline economic forecast contains the initial economic assumptions used in the NEMS to help determine energy demand and supply. The MAM can also provide the NEMS with alternative economic assumptions representing a range of uncertainty about economic growth. Differing assumptions regarding the path of world oil prices or of the penetration of new technologies can also be modeled in the MAM. The resulting economic impacts of such assumptions are inputs to the remaining supply and demand modules of the NEMS. Outside of the Annual Energy Outlook setting, the MAM represents a system of linked modules capable of assessing the potential impacts on the economy of changes in energy events or of policy proposals as specified by a non-EIA requestor. These economic impacts result from assumptions about energy events resulting from policy proposals built into the NEMS. The linked modules of the NEMS then iterate to a solution..

This report documents the objectives and analytical approach of the MAM that is used to develop the Annual Energy Outlook for 2009 (AEO 2009). It serves as a reference document providing a description of the MAM used for the AEO 2009 production runs for model analysts, users, and the public. It also facilitates continuity in model development by providing documentation from which energy analysts can undertake model enhancement and modifications. This documentation report is divided into two separate components.

Part A presents the structural models comprising the MAM. These include:

1. Global Insight's model of the U.S. economy,
2. Global Insight's models of industrial output and of employment by industry and
3. Energy Information Administration's models of the regional economies.

Part B focuses on the MAM's interface with the NEMS. This section identifies the set of model levers and simulation rules used to operate the system. It also provides a discussion of three types of integrated simulations carried out with the NEMS. This section also views the MAM from the perspective of a programmer focusing on the ties that link the various models together to form the MAM and how the MAM communicates with the NEMS.

Appendices A and B provide detailed information on variable listings and sectoral definitions.

Appendix C provides a detailed listing of the equations for the regional models.

Part A
STRUCTURAL MODELS COMPRISING THE MAM

1. Modeling System Overview

Economic activity driving the National Energy Modeling System (NEMS) is determined by an economic modeling system comprised of three sets of models:

1. Global Insight's model of the U.S. economy,
2. Global Insight's industrial output and employment by industry models and
3. Energy Information Administration's (EIA) regional models.

Global Insight's model of the U.S. economy is the same model used by Global Insight, Inc. to produce its economic forecasts for the company's monthly assessment of the U.S. economy. The Global Insight U.S. model used for the AEO 2009 is the US2006A version. EIA's industrial output and employment by industry models are derivatives of Global Insight's industrial output and employment by industry models. The models have been tailored in order to provide the industrial output and employment by industry detail required by the NEMS modeling system. EIA's regional models consist of models of economic activity, industrial output, employment by industry and commercial floorspace. The first two models were developed during 2004 for use in the preparation of the Annual Energy Outlook (AEO) 2005. The regional models were re-estimated for the AEO 2009.

All of the MAM models are linked to provide a fully integrated approach to forecasting economic activity at the national, industrial and regional levels. Global Insight's model of the U.S. economy determines the national economy's growth path and the final demand mix. EIA's industrial output model ensures that supply by industry is consistent with the final demands (consumption, investment, government spending, exports and imports) forecasted in the U.S. model. Industrial output is the key driver of the employment forecast in EIA's employment by industry model. The employment by industry forecast also incorporates aggregate hours per week and productivity trends forecasted in the U.S. model. The employment by industry forecast is aligned with the aggregate employment forecast of the U.S. model. Key inputs to EIA's regional models include forecasts of national output, employment by industry, population, nation income and housing activity. EIA's regional models then forecast levels of industrial output, employment by industry, population, incomes, and housing activity for each of the nine Census Divisions. The sum of each of these concepts across the nine Census Divisions is aligned with the national totals forecasted by the U.S. model. Together, these models of the U.S. economy, industrial output, employment by industry and of regional economic activity constitute the Macroeconomic Activity Module (MAM) of the National Energy Modeling System (NEMS).

Before the MAM can execute its suite of models though, it requires exogenous assumptions regarding energy prices, consumption and domestic production. Over seventy energy prices and quantities are extracted from the output of the demand and supply modules of the NEMS. Transformations of the exogenous assumptions are necessary to map these inputs from the NEMS into more aggregated concepts in the MAM. After the appropriate transformations are done, the U.S., industrial output, employment by industry and regional models execute in sequence to produce a forecast of economic activity at the national, industrial and regional levels. Drawn from the forecast are economic driver variables that are then passed to the supply, demand and conversion modules of the NEMS. The NEMS then reacts to the new economic activity assumptions. Forecasts of energy prices and quantities based upon these new economic assumptions are then passed back to the MAM. A NEMS "cycle" is completed once all the modules of the NEMS solve. Cycles are repeated as the NEMS iterates to a stable solution.

There are a few industrial output and employment by industry concepts whose forecast in the MAM are determined by the NEMS. The MAM's forecast of industrial output for the five energy-related sectors are based upon growth rates extracted from the appropriate modules in the NEMS. The growth rates in output of petroleum refining, coal mining, oil and gas extraction, electric utilities and gas utilities are applied to the last historical value of the appropriate series in the MAM's industrial output model. A similar computation is done for employment by industry but for only two of the five energy sectors. Growth in employment is computed for coal mining and for oil and gas extraction using forecasts from the appropriate NEMS modules. These growth rates are then applied to the last historical value of the appropriate series in the MAM's employment by industry model.

Global Insight's Model of the U.S. Economy

Key Inputs: National population by age cohort, total factor productivity, federal tax rates and nominal expenditures, money supply, energy prices and quantities and GDP of major and other important trading partners.
Key Outputs: Final demands (consumption, investment, government purchases, exports, imports), inflation, foreign exchange and interest rates, incomes, employment, federal and state/local government revenues and expenditures and balance of payments.

Global Insight's Industrial Output Model

Key Inputs: Final demands, prices and productivity measures from Global Insight's model of the U.S. economy and input-output coefficient matrix.
Key Outputs: Real output value (defined by value of shipments or revenue) for sixty industrial and service sectors.

Global Insight's Employment by Industry Model

Key Inputs: Industrial outputs from the industrial output model, capital service cost determinants, productivity measures and total employment from Global Insight's model of the U.S. economy.
Key Outputs: Employment for fifty-nine industrial and service sectors.

Energy Information Administration's Regional Economic Activity Model

Key Inputs: National gross domestic product, wages, incomes, population, housing activity and prices from Global Insight's model of the U.S. economy. State population estimates and projections from the U.S. Bureau of the Census.
Key Outputs: Wages and salaries, personal income, disposable income, population and housing activity for the nine Census Divisions.

Energy Information Administration's Regional Industrial Output and Employment by Industry Models

Key Inputs: National sectoral output, prices and employment from the industrial output and employment by industry models; regional gross product, disposable income, prices, interest rates, population, wages and salaries and housing activity from the regional economic activity model.
Key Outputs: Output value and employment for forty-five industrial output and service sectors for the nine Census Divisions.

Energy Information Administration's Regional Commercial Floorspace Model

Key Inputs: Gross domestic product, consumer spending, employment, private investment, change in business inventories, interest rates, population and lagged values of additions and stocks.
Key Outputs: Commercial floorspace in thousand square feet for thirteen commercial floorspace types in each of the nine Census Divisions.

Each of these models is discussed below, with further detail presented in the Appendixes to this document.

2. Global Insight's Model of the U.S. Economy

The Model's Theoretical Position

Econometric models built in the 1950s and 1960s were largely Keynesian income-expenditure systems that assumed a closed domestic economy. High computation costs involving statistical estimation and model manipulation, along with the underdeveloped state of macroeconomic theory, limited the size of the models and the richness of the linkages of spending to financial conditions, inflation, and international developments. Since that time, however, computer costs have fallen spectacularly; macroeconomic theory has also benefited from five decades of postwar data observation and from the intellectual attention of many eminent economists.

An Econometric Dynamic Equilibrium Growth Model: Global Insight's model of the U.S. economy strives to incorporate the best insights of many theoretical approaches to the business cycle: Keynesian, neoclassical, monetarist, supply-side and rational expectations. In addition, Global Insight's model of the U.S. economy embodies the major properties of the *long-term* growth models presented by James Tobin, Robert Solow, Edmund Phelps and others. This structure guarantees that short-run cyclical developments will converge to a robust long-run equilibrium.

In growth models, the expansion rates of technical progress, the labor force and the capital stock, both physical capital and human capital, determine the productive potential of an economy. Both technical progress and the capital stock are governed by investment, which in turn must be in balance with post-tax capital costs, available savings and the capacity requirements of current spending. As a result, monetary and fiscal policies will influence both the short- and the long-term characteristics of such an economy through their impacts on national saving and investment.

A modern model of output, prices and financial conditions is melded with the growth model to present detailed, short-run dynamics of the economy. In specific goods markets, the interactions of a set of supply and demand relations jointly determine spending, production, and price levels. Typically, the level of inflation-adjusted demand is driven by prices, income, wealth, expectations and financial conditions. The capacity to supply goods and services is keyed to a production function combining the basic inputs of labor hours, energy usage, and the capital stocks of business equipment and structures and government infrastructure. The "total factor productivity" of this composite of tangible inputs is driven by expenditures on research and development that produce technological progress.

Prices adjust in response to short-run gaps between current production and supply potential and to changes in the cost of inputs. Wages adjust to labor supply-demand gaps (indicated by a demographically-adjusted unemployment rate), current and expected inflation (with a unit long-run elasticity), productivity, tax rates and minimum wage legislation. The supply of labor

responds positively to the perceived availability of jobs, to the after-tax wage level and to the growth and age-gender mix of the population. Demand for labor is keyed to the level of output in the economy and to the productivity of labor, capital and energy. Because the capital stock does not change much in the short run, a higher level of output requires more employment and energy inputs. Such increases are not necessarily equal to the percentage increase in output because of the improved efficiencies typically achieved during an upturn. Tempering the whole process of wage and price determination is the exchange rate; a rise signals prospective losses of jobs and markets unless costs and prices are reduced.

For financial markets, the model predicts exchange rates, interest rates, stock prices, loans and investments interactively with the preceding GDP and inflation variables. The Federal Reserve sets the supply of reserves in the banking system and the fractional reserve requirements for deposits. Private sector demands to hold deposits are driven by national income, expected inflation and by the deposit interest yield relative to the yields offered on alternative investments. Banks and other thrift institutions, in turn, set deposit yields based on the market yields of their investment opportunities with comparable maturities and on the intensity of their need to expand reserves to meet legal requirements. In other words, the contrast between the supply and demand for reserves sets the critical short-term interest rate for interbank transactions, the federal funds rate. Other interest rates are keyed to this rate, plus expected inflation, Treasury borrowing requirements and sectoral credit demand intensities.

The old tradition in macroeconomic model simulations of exogenous fiscal policy changes was to hold the Federal Reserves supply of reserves constant at baseline levels. While this approach makes static analysis easier in the classroom, it sometimes creates unrealistic policy analyses when a dynamic model is appropriate. In Global Insight's model of the U.S. economy, "monetary policy" is defined by a set of targets, instruments and regular behavioral linkages between targets and instruments. The model user can choose to define unchanged monetary policy as unchanged reserves, or as an unchanged reaction function in which interest rates or reserves are changed in response to changes in such policy concerns as the price level and the unemployment rate.

Monetarist Aspects: The model pays due attention to valid lessons of monetarism by carefully representing the diverse portfolio aspects of money demand and by capturing the central bank's role in long-term inflationary trends.

The private sector may demand money balances as one portfolio choice among transactions media (currency, checkable deposits), investment media (bonds, stocks, short-term securities) and durable assets (homes, cars, equipment, structures). Given this range of choices, each asset's implicit and explicit yield must therefore match expected inflation, offset perceived risk and respond to the scarcity of real savings. Money balances provide benefits by facilitating spending transactions and can be expected to rise nearly proportionately with transactions requirements unless the yield of an alternative asset changes.

Now that even demand deposit yields can float to a limited extent in response to changes in Treasury bill rates, money demand no longer shifts quite as sharply when market rates change. Nevertheless, the velocity of circulation (the ratio of nominal spending to money demand) is still far from stable during a cycle of monetary expansion or contraction. Thus the simple monetarist link from money growth to price inflation or nominal spending is therefore considered invalid as a rigid short-run proposition.

Equally important, as long-run growth models demonstrate, induced changes in capital formation can also invalidate a naive long-run identity between monetary growth and price increases. Greater demand for physical capital investment can enhance the economy's supply potential in the event of more rapid money creation or new fiscal policies. If simultaneous, countervailing influences deny an expansion of the economy's real potential, the model *will* translate all money growth into a proportionate increase in prices rather than in physical output.

Supply-Side Economics: Since 1980, supply-side political economists have pointed out that the economy's growth potential is sensitive to the policy environment. They focused on potential labor supply, capital spending and savings impacts of tax rate changes. Global Insight's model of the U.S. economy embodies supply-side hypotheses to the extent supportable by empirical evidence embodied in the available data. This is considerable in the many areas that supply-side hypotheses share with long-run growth models. These features, however, have been fundamental ingredients of the model since 1976.

Rational Expectations: As the rational expectations school has pointed out, much of economic decision-making is forward looking. For example, the decision to buy a car or a home is not only a question of current affordability but also one of timing. The delay of a purchase until interest rates or prices decline has become particularly common since the mid-1970s when both inflation and interest rates were very high and volatile. Consumer sentiment surveys, such as those conducted by the University of Michigan Survey Research Center, clearly confirm this speculative element in spending behavior.

However, households can be shown to base their expectations, to a large extent, on their past experiences: they believe that the best guide to the future is an extrapolation of recent economic conditions and the changes in those conditions. Consumer sentiment about whether this is a "good time to buy" can therefore be successfully modeled as a function of recent levels and changes in employment, interest rates, inflation and inflation expectations. Similarly, inflation expectations (influencing financial conditions) and market strength expectations (influencing inventory and capital spending decisions) can be modeled as functions of recent rates of increase in prices and spending.

This largely retrospective approach is not, of course, wholly satisfactory to pure adherents of the rational expectations doctrine. In particular, this group argues that the announcement of macroeconomic policy changes would significantly influence expectations of inflation or growth prior to any realized change in prices or spending. If an increase in government expenditures is

announced, the argument purports, expectations of higher taxes to finance the spending might lead to lower consumer or business spending in spite of temporarily higher incomes from the initial government spending stimulus. A rational expectations theorist would thus argue that multiplier effects will tend to be smaller and more short-lived than a mainstream economist would expect.

These propositions are subject to empirical evaluation. Global Insight's conclusions are that expectations do play a significant role in private sector spending and investment decisions; but, until change has occurred in the economy, there is very little room for significant changes in expectations in advance of an actual change in the variable about which the expectation is formed. The rational expectations school thus correctly emphasizes a previously understated element of decision-making, but exaggerates its significance for economic policy-making and model building.

Global Insight's model of the U.S. economy allows a choice in this matter. On the one hand, the user can simply accept Global Insight's judgments and let the model translate policy initiatives into initial changes in the economy, simultaneous or delayed changes in expectations, and subsequent changes in the economy. On the other hand, the user can manipulate the clearly identified expectations variables in the model, i.e., consumer sentiment, and inflation expectations. For example, if the user believes that fear of higher taxes would subdue spending; the user could reduce the consumer sentiment index.

Theory as a Constraint: The conceptual basis of each equation in Global Insight's model of the U.S. economy was thoroughly worked out before the regression analysis was initiated. The list of explanatory variables includes a carefully selected set of demographic and financial inputs. Each estimated coefficient was then thoroughly tested to be certain that it meets the tests of modern theory and business practice. This attention to equation specification and coefficient results has eliminated the "short circuits" that can occur in evaluating a derivative risk or an alternative policy scenario. Because each equation will stand up to a thorough inspection, Global Insight's model is a reliable analytical tool and can be used without excessive iterations. The model is not a black box: it functions like a personal computer spreadsheet in which each interactive cell has a carefully computed, theoretically consistent entry and thus performs logical computations simultaneously.

Major Sectors

Global Insight's model of the U.S. economy captures the full simultaneity of the U.S. economy, forecasting over 1700 concepts spanning final demands, aggregate supply, prices, incomes, international trade, industrial detail, interest rates and financial flows. The chart below summarizes the structure of the eight interactive sectors (in Roman numerals). The following discussion presents the logic of each sector and significant interactions with other sectors.

Spending - Consumer: The domestic spending (I), income (II) and tax policy (III) sectors model the central circular flow of behavior as measured by the national income and product accounts. If the rest of the model were "frozen", these blocks would produce a Keynesian system similar to the models pioneered by Tinbergen and Klein, except that neoclassical price factors have been imbedded in the investment and other primary demand equations.

Consumer spending on durable goods is divided into nine categories: light vehicles; used automobiles; motor-vehicle parts; other vehicles; computers; software; other household equipment and furnishings; ophthalmic and orthopedic products and "other". Spending on non-durable goods is divided into nine categories: three food categories, clothing and shoes, gasoline and oil, fuel oil and coal, tobacco, drugs and "other". Spending on services is divided into sixteen categories: housing, six household operation subcategories, four transportation categories, medical, recreation, two personal business service categories and "other". (see Table A1) In nearly all cases, real consumption expenditures are motivated by real income and the consumer price of a particular category relative to the prices of other consumer goods. Durable and semi-durable goods are also especially sensitive to current financing costs, and consumer speculation on whether it is a "good time to buy". The University of Michigan Survey of Consumer Sentiment monitors this last influence; with the index itself modeled as a function of current and lagged values of inflation, unemployment and the prime rate.

Spending - Business Investment: Business spending includes nine fixed investment categories for equipment and seven for construction: four information processing equipment categories, industrial equipment, three transportation equipment categories, other producers' durable equipment, four building categories, mines and wells and two public utility structures. (see Table A2) Equipment and business structures (non-utility, non-mining) spending components are determined by their specific effective post-tax capital costs, capacity utilization and replacement needs. The cost terms are sophisticated blends of post-tax debt and equity financing costs (offset by expected capital gains) and the purchase price of the investment good (offset by possible tax credits and depreciation-related tax benefits). This updates the well-known work of Dale Jorgenson, Robert Hall and Charles Bischoff.

Given any cost/financing environment, the need to expand capacity is monitored by recent growth in national goods output weighted by the capital intensity of such production. Public utility structure expenditures are motivated by similar concepts except that the output terms are restricted to utility output rather than total national goods output. Net investment in mining and petroleum structures responds to movements in real domestic oil prices and to oil and natural gas production.

Inventory demand is the most erratic component of GDP, reflecting the pro-cyclical, speculative nature of private sector accumulation during booms that is then drawn down during downturns. The forces that drive the five non-farm inventory categories are changes in spending, short-term interest rates and expected inflation, surges in imports and changes in capacity utilization or the speed of vendor deliveries. Unexpected increases in demand lead to an immediate draw down of

stocks that are then rebuilt over time; the reverse naturally holds for sudden reductions in final demand. Inventory demands are sensitive to the cost of holding the stock, measured by such terms as interest costs adjusted for expected price increases and by variables monitoring the presence of bottlenecks. The cost of a bottleneck that slows delivery times is lost sales: an inventory spiral can therefore be set in motion when all firms accelerate their accumulation during a period of strong growth but then try to deplete excessive inventories when the peak is past.

Spending - Residential Investment: The residential investment sector of the model includes two housing starts (single and multi-family starts) and three housing sales categories (new and existing single family sales and new single family units for sale). Housing starts and sales, in turn, drive investment demand in five GDP account categories: single family housing; multi-family housing; improvements; other residential structure and residential equipment. (see Table A3)

Residential construction is typically the first sector to contract in a recession and the first to rebound in a recovery. Moreover, the magnitude of the building cycle is a prominent determinant of the subsequent macroeconomic cycles. The housing sector of Global Insight's model of the U.S. economy explains new construction as a decision primarily based upon the after-tax cost of home ownership relative to disposable income. This cost is estimated as the product of the average new home price adjusted for changes in quality; and the mortgage rate, plus operating costs, property taxes and an amortized down payment. "Lever variables" allow the model user to specify the extent to which mortgage interest payments, property taxes and depreciation allowances (for rental properties) produce tax deductions that reduce the effective cost.

The equations also include a careful specification of demographic forces. After estimating changes in the propensity of specific age-gender groups to form independent households, the resulting "headship rates" are multiplied by corresponding population statistics to estimate the trend expansion of single- and multi-family households. The housing equations are then specified to explain current starts relative to the increase in trend households over the past year, plus pent-up demand and replacement needs. The basic phenomenon being scrutinized is therefore the proportion of the trend expansion in households whose housing needs are met by current construction. The primary determinants of this proportion are housing affordability, consumer confidence and the weather. Actual construction spending in the GDP accounts is the value of construction "put-in-place" in each period after the start of construction (with a lag of up to six quarters in the case of multi-family units), plus residential improvements and brokerage fees.

Spending - Government: The last sector of domestic demand for goods and services, that of the government, is largely exogenous (user-determined) at the federal level and endogenous (equation-determined) at the state and local level. The user sets the real level of federal non-defense and defense purchases (for compensation, consumption of fixed capital, Commodity Credit Corporation inventory change, other consumption and gross investment), medical and

non-medical transfer payments and medical and non-medical grants to state and local governments. The model calculates the nominal values through multiplication by the relevant estimated prices. Transfers to foreigners, wage accruals and subsidies (agricultural, housing and other) are also specified by the user, but in nominal dollars. One category of federal government spending – net interest payments – is determined within the model because of its dependence on the model's financial and tax sectors. Net federal interest payments are determined by the level of privately-held federal debt, short and long-term interest rates and the maturity of the debt. (see Table A4)

The presence of a large and growing deficit imposes no constraint on federal spending. This contrasts sharply with the state and local sector where legal requirements for balanced budgets mean that declining surpluses or emerging deficits produce both tax increases and reductions in spending growth. State and local purchases (for compensation, consumption of fixed capital, other consumption and construction) are also driven by the level of federal grants (due to the matching requirements of many programs), population growth and trend increases in personal income. (see Table A5)

Income: Domestic spending, adjusted for trade flows, defines the economy's value-added or gross national product (GNP) and gross domestic product (GDP). Because all value-added must accrue to some sector of the economy, the expenditure measure of GNP (GDP plus net exports of factor services) also determines the nation's gross income. The distribution of income among households, business, and government is determined in sectors II and III of the model.

Pre-tax income categories include private and government wages, corporate profits, interest, rent and entrepreneurial returns. Each pre-tax income category except corporate profits is determined by some combination of wages, prices, interest rates, debt levels and capacity utilization or unemployment rates. In some cases such as wage income, these are identities based on previously calculated wage rates, employment and hours per week.

Profits are logically the most volatile component of GNP on the income side. When national spending changes rapidly, the contractual arrangements for labor, borrowed funds and energy imply that the return to equity holders is a residual that will soar in a boom and collapse in a recession. The model reflects this by calculating wage, interest and rental income as thoroughly reliable near-identities (e.g., wages equal average earnings multiplied by hours worked) and then subtracting each non-profit item from national income to solve for profits. (see Tables A6 and A7)

Taxes: Since post-tax rather than pre-tax incomes drive expenditures, each income category must be taxed at an appropriate rate; the model therefore tracks personal, corporate, payroll and excise taxes separately. Users may set federal tax rates; tax revenues are then simultaneously forecast as the product of the rate and the associated pre-tax income components. However, the model automatically adjusts the effective average personal tax rate for variations in inflation and income per household and the effective average corporate rate for credits earned on equipment,

utility structures and R&D. Substitutions or additions of “flat” taxes and value-added taxes for existing taxes are accomplished with specific tax rates and new definitions of tax bases. As appropriate, these are aggregated into personal, corporate or excise tax totals.

State and local corporate profits and social insurance (payroll) tax rates are exogenous in the model, while personal income and excise taxes are fully endogenous: the U.S. model makes reasonable adjustments automatically to press the sector toward the legally-required approximate budget balance. The average personal tax rate rises with income and falls with the government-operating surplus. Property and sales taxes provide the bulk of state excise revenue and reflect changes in oil and natural gas production, gasoline purchases and retail sales, as well as revenue requirements. The feedback from expenditures to taxes and taxes to expenditures works quite well in reproducing both the secular growth of the state and local sector and its cyclical volatility. (see Table A8)

International: The international sector (IV) is a critical, fully simultaneous block that can either add or divert strength from the central circular flow of domestic income and spending. Depending on the prices of foreign output, the U.S. exchange rate and competing domestic prices, imports capture varying shares of domestic demand.

Depending on similar variables and the level of world gross domestic product, exports can add to domestic spending on U.S. production. The exchange rate itself responds to international differences in inflation, interest rates, trade deficits and capital flows between the U.S. and its competitors. In preparing forecasts, Global Insight's U.S. Economic Service and the World Service collaborate in determining internally consistent trade prices and volumes, interest rates and financial flows.

Eight categories of goods and one of services are modeled separately for both imports and exports, with one additional goods category for oil imports. (see Table A9) For example, export and import detail for business machines is included as a natural counterpart to the inclusion of the office equipment component of producers' durable equipment spending. The business machines detail allows more accurate analysis because computers are rapidly declining in effective quality-adjusted prices relative to all other goods, and because such equipment is rising rapidly in prominence as businesses push ahead with new production and information processing technologies.

Investment income flows are also explicitly modeled. The stream of huge current account deficits incurred by the U.S. has important implications for the U.S. investment income balance. As current account deficits accumulate, the U.S. net international investment position and the U.S. investment income balance deteriorate. U.S. foreign assets and liabilities are therefore included in the model, with the current account deficit determining the path of the net investment position.

The reactions of overseas prices, interest rates and GDP to U.S. development are robust and

automatic. In the case of depreciation in the dollar, for example, U.S. activity may expand at the expense of foreign activity and U.S. inflation may rise while the rate in other countries slows.

Financial: The use of a detailed financial sector (V) and of interest rate and wealth effects in the spending equations recognizes the importance of credit conditions on the business cycle and on the long-run growth prospects for the economy.

Interest rates, the key output of this sector, are modeled as a term structure, pivoting off the federal funds rate. As noted earlier, the model gives the user the flexibility of using the supply of reserves as the key monetary policy instrument, reflecting the Federal Reserve's open market purchases or sales of Treasury securities, or using a reaction function as the policy instrument. If the supply of reserves is chosen as the policy instrument, the federal funds rate depends upon the balance between the demand and supply of reserves to the banking system. Banks and other thrift institutions demand reserves to meet the reserve requirements on their deposits and the associated (exogenous) fractional reserve requirements. The private sector in turn demands deposits of various types, depending on current yields, income, and expected inflation.

If the reaction function is chosen as the monetary policy instrument, the federal funds rate is determined in response to changes in such policy concerns as inflation and unemployment. The reaction function recognizes that monetary policy seeks to stabilize prices (or to sustain a low inflation rate) and to keep the unemployment rate as close to the natural rate as is consistent with the price objective. A scenario designed to display the impact of a fiscal policy change in the context of unchanged monetary policy is arguably more realistic when unchanged or traditional reactions to economic cycles are recognized, than when the supply of reserves is left unchanged.

Longer-term interest rates are driven by shorter-term rates as well as factors affecting the slope of the yield curve. In Global Insight's model of the U.S. economy, such factors include inflation expectations, government borrowing requirements and corporate financing needs. The expected real rate of return varies over time and across the spectrum of maturities. An important goal of the financial sector is to capture both the persistent elements of the term structure and to interpret changes in this structure. Twenty-four interest rates are covered in order to meet client needs regarding investment and financial allocation strategies. (see Table A10)

Inflation: Inflation (VI) is modeled as a carefully controlled, interactive process involving wages, prices and market conditions. Equations embodying a near accelerationist point of view produce substantial secondary inflation effects from any initial impetus such as a change in wage demands or a rise in foreign oil prices. Unless the Federal Reserve expands the supply of credit, real liquidity is reduced by any such shock. Given the real-financial interactions described above, this can significantly reduce growth. The process also works in reverse: a spending shock can significantly change wage-price prospects and then have important secondary impacts on financial conditions. Inspection of the simulation properties of Global Insight's model of the U.S. economy, including full interaction among real demands, inflation and financial conditions, confirms that the model has moved towards a central position in the controversy between

fiscalists and monetarists, and in the debates among neoclassicists, institutionalists and rational expectationists.

The principal domestic cost influences are labor compensation, non-farm productivity (output per hour) and foreign input costs. The latter are driven by the exchange rate, the price of oil and foreign wholesale price inflation. Excise taxes paid by the producer are an additional cost fully fed into the pricing decision. This set of cost influences drives *each* of the nineteen industry-specific producer price indexes, in combination with a demand pressure indicator and appropriately weighted composites of the other eighteen producer price indexes. In other words, the inflation rate of each industry price index is the reliably weighted sum of the inflation rates of labor, energy, imported goods and domestic intermediate goods; plus a variable markup reflecting the intensity of capacity utilization or the presence of bottlenecks. If the economy is in balance--with an unemployment rate near 5%, manufacturing capacity utilization steady near 80 to 85%, and foreign influences neutral--then prices will rise in line with costs and neither will show signs of acceleration or deceleration.

Supply: The first principle of the market economy is that prices and output are determined simultaneously by the factors underlying both demand and supply. As noted above, the "supply-siders" have not been neglected in Global Insight's model of the U.S. economy; indeed, substantial emphasis on this side of the economy (VII) was incorporated as early as 1976. In Global Insight's model of the U.S. economy, aggregate supply is estimated by a Cobb-Douglas production function that combines factor input growth and improvements in total factor productivity. Factor input equals a weighted average of labor, business fixed capital, public infrastructure and energy provided by the energy sector. Based upon each factor's historical share of total input costs, the elasticity of potential output with respect to labor is 0.65 (i.e., a 1% increase in the labor supply increases potential GDP 0.65%); the business capital elasticity is 0.26; the infrastructure elasticity is 0.025; and the energy elasticity is 0.07. Factor supplies are defined by estimates of the full employment labor force, the full employment capital stock, end-use energy demand and the stock of infrastructure. To avoid double-counting energy input, the labor and capital inputs are both adjusted to deduct estimates of the labor and capital that produce energy. Potential GDP is the sum of the aggregate supply concept derived from the production function, less net energy imports, plus housing services and the compensation of government employees. Total factor productivity depends upon the stock of research and development capital and trend technological change.

Taxation and other government policies influence labor supply and all investment decisions; thereby linking tax changes to changes in potential GDP. An expansion of potential GDP first reduces prices and then credit costs; thus spurring demand. Demand rises until it equilibrates with potential output. Therefore, the growth of aggregate supply is the fundamental constraint on the long-term growth of demand. Inflation, created by demand that exceeds potential GDP or by a supply-side shock or excise tax increase, raises credit costs and weakens consumer sentiment, thus putting the brakes on aggregate demand.

Expectations: The contributions to the model of the U.S. economy and its simulation properties of the rational expectations school are as rich as the data will support. Expectations (Sector VIII) impact several expenditure categories in Global Insight's model of the U.S. economy, but the principle nuance relates to the entire spectrum of interest rates. Shifts in price expectations or the expected capital needs of the government are captured through price expectations and budget deficit terms, with the former impacting the level of rates throughout the maturity spectrum, and the latter impacting intermediate and long-term rates, and hence affecting the shape of the yield curve. On the expenditure side, inflationary expectations impact consumption via consumer sentiment, while growth expectations affect business investment.

3. Global Insight's Industrial Output and Employment by Industry Models

Industrial Output Model Overview

The industrial output model is a combination input-output/stochastic model of activity for sixty industries and service sectors in the U.S. The model forecasts the real value of shipments, or revenue, as a measure of output for each sector. The output level generated in the industrial output model reflects a level of domestic production that is consistent with the economic expenditures generated in Global Insight's model of the U.S. economy. Table A11 identifies the economic expenditure categories driving the industrial output model. Table A12 identifies the concept coverage of the model and the industry coverage of the model.

The industrial and services sectors are defined according to the North American Industry Classification System (NAICS). The industry details follow the manufacturing industries reported by the Department of Commerce in its monthly Manufacturers' Shipments, Inventories and Orders survey. Details are mostly three or four-digit NAICS aggregations with some dissaggregations beyond four digits. The non-manufacturing industries and the service sectors are two, three or four-digit NAICS aggregations.

The input-output block of the model translates macroeconomic forecasts from Global Insight's model of the U.S. economy into demand by industry. All other model concepts are projected by statistical equations and identities.

The model projections are at a quarterly frequency. Historical data supporting the model are, for the most part, monthly series released by various government agencies typically within a few months of the observation. All data, unless otherwise specified, are seasonally adjusted at annual rates.

The Input-Output Block

Standard input-output analysis proceeds in two steps. First, the vector of economic expenditures from the macroeconomic model (the components of GDP) is converted into a vector of industrial deliveries to final demand. This conversion is represented for any time period as:

$F = H * G$

Where:
F = vector of industrial deliveries to final demand
H = benchmark bridge matrix recording the industrial composition of each expenditure category
G = vector of the real final expenditure components of GDP

A fixed bridge matrix, constructed from the 1992 input-output table that was based on the Standard Industrial Classification (SIC), is used in this step. The differences caused by the change in classification from SIC to NAICS are ignored in the current version. Once the final demand vector, F, has been calculated, standard input-output techniques are used to derive estimates of the industrial output required to produce this bill of goods for final use. According to the basic input-output model, intermediate inputs, industrial deliveries to final demand and gross output are related as follows:

$A * X + F = X$

Where:
A = matrix of direct input coefficients describing the amount of each input industry's product required per unit of industrial output
X = vector of gross output by industry

This equation can be considered an equilibrium condition; that is, total demand equals total supply. The product A * X is equal to intermediate demand, and F is equal to final demand. The sum of the two is total demand; which, in equilibrium, is equal to total supply or production.

Following standard input-output conventions, it is assumed that the technology of production as reflected by the matrix of direct input coefficients, A, remains relatively stable over time. In addition, production processes are assumed to be linear and exhibit constant returns to scale with no possibility for substitution among inputs. However, these restrictions apply for the calculation of demand by industry only; equations for actual shipments and production include factors that offset these restrictive assumptions statistically.

The basic input-output equation is then solved for output:

$X = (I - A)^{-1} * F$

This equation describes the relationship between final demand and industrial output levels that would be required to deliver this bill of goods under the restrictive assumptions detailed above. The vector X should equal total demand and supply for each industry, in equilibrium.

Revenue/Output for Manufacturing Industries

Industry revenues are measured in billions of constant dollars and are available for each of the manufacturing industries in the model. The current dollar historical series are quarterly averages of the Department of Commerce's value of shipments data from its monthly Manufacturers' Shipments, Inventories and Orders survey that are converted to annual rates. Constant dollar historical values are the current dollar series deflated using each industry's price index. These indexes are computed outside of the model provided by Global Insight's U.S. Industry Service,

which produces short-term industry forecasts. To attain consistency with the economic variables in the macroeconomic model, industry revenues are converted into constant 2000 dollars after the model is run.

Constant dollar revenue by industry is modeled as a function of total demand from the input-output analysis, relative prices, cyclical variables and a time trend. The functional form used imposes a unitary elasticity on the demand term, which embodies most of the explanatory power of the equations. Generally, the economic expenditure categories from the macroeconomic model have incorporated in them the effect of changes in prices. However, a relative price variable is used in select industries to explicitly capture the industry-specific effect of changes in producer prices.

Additional non-demand terms are included in the equation used to explain patterns not well accounted for by the input-output model and its demand cyclicality and technological change indicators.

1. Macroeconomic variables feed down into the industrial output equations through demand, but these weighted demand terms are in most cases smoother and less cyclical than industrial production indexes. Therefore, cyclical variables, such as capacity utilization, housing starts, unemployment rate or interest rates, are included in most equations. Cyclical variables were chosen with care to reflect the appropriate business cycle for each industry.

2. The use of constant 1992 input-output tables in the construction of total demand becomes less accurate the further from the base year the estimates go. This is because shifts in relative prices for inputs, as well as other factor, can in the long run change the technological processes used to manufacture goods. To account for this slowly changing divergence between input-output coefficients and actual production processes, a time trend is used in many model equations that use input-output concepts.

log(R{ind}R / D{ind}R) = F(log(Cyclical variable), Other cyclical variables, log(Relative prices), Trend)

Where:
R{ind}R = constant dollar revenue, industry ind
D{ind}R = total input-output demand, industry ind
Trend = time trend variable

Output is measured in real dollars for all industries except two. Rapid increases in computer technology in the last two decades have led to sharp declines in the quality-adjusted price deflators for computer manufacturing (NAICS 3341) and semiconductor manufacturing (NAICS 334413). This in turn results in steep increases in the industries' real dollar output measures.

This makes the real output value an inappropriate proxy for volume measure. Consequently, nominal dollars rather than real dollars are used to for these two sectors.

Revenue/Output for Non-manufacturing Industries/Services

For non-manufacturing industries and services sectors, sales revenue is the main activity indicator available. Historical data are collected from the Bureau of Labor Statistics and other sources. The common criterion for the data is that conceptually it should be as close as possible to the measure of value of production or total gross output, rather than value added, and the current dollar measure is roughly equivalent to revenue.

Forecasts of non-manufacturing revenue are calculated from equations of the same form as the manufacturing revenue equations:

log(R{ind}R / D{ind}R) = F(log(Cyclical variable), Other cyclical variables, log(Relative prices), Trend)

Where:

R{ind}R = constant dollar revenue, industry or service sector ind
D{ind}R = total input output demand, industry or service sector ind
Trend = time trend variable

Aggregation to the NEMS Sectors

The sectoral classification in the Macroeconomic Activity Module is more aggregate than Global Insight's classification. It comprises thirty-five industrial sectors and ten service sectors. Of the thirty-five industrial sectors, twenty-nine are manufacturing sectors and six are non-manufacturing industrial sectors. Five of the sectors are energy sectors. For these sectors, production forecasts are available from other NEMS modules and their forecasted growth rates are applied to the historical data in place of the MAM's model forecast.

One of the main users of the output values is the NEMS's Industrial Demand Module. In that module, the thirty-five industries are further aggregated into nineteen categories. Below is a list of the forty-five sectors maintained in the Macroeconomic Activity Module and their corresponding Industrial Demand categories. The concordance between Global Insight's codes and the forty-five sectors is presented in Table A12.

NEMS Macroeconomic Activity Module	NEMS Industrial Demand Module
Manufacturing Industries:	
Food Products	Food Products
Beverage and Tobacco Products	Remaining Balance of Manufacturing
Textile Mills & Textile Products	Remaining Balance of Manufacturing
Apparel	Remaining Balance of Manufacturing
Wood Products	Wood Products
Furniture and Related Products	Remaining Balance of Manufacturing
Paper Products	Paper and Allied Products
Printing	Remaining Balance of Manufacturing
Basic Inorganic Chemicals	Inorganic Chemicals
Basic Organic Chemicals	Organic Chemicals
Plastic and Synthetic Rubber Materials	Resins
Agricultural Chemicals	Agricultural Chemicals
Other Chemical Products	Remaining Balance of Manufacturing
Petroleum Refineries *	Petroleum Refining
Other Petroleum and Coal Products	Remaining Balance of Manufacturing
Plastics and Rubber Products	Plastics and Rubber Products
Leather and Allied Products	Remaining Balance of Manufacturing
Glass & Glass Products	Glass and Glass Products
Cement Manufacturing	Cement
Other Non-metallic Mineral Products	Remaining Balance of Manufacturing
Iron & Steel Mills, Ferroalloy & Steel Products	Iron and Steel
Alumina & Aluminum Products	Aluminum
Other Primary Metals	Remaining Balance of Manufacturing
Fabricated Metal Products	Fabricated Metal Products
Machinery	Machinery
Other Electronic & Electric Products	Computer and Electronic Products
Transportation Equipment	Transportation Equipment
Measuring & Control Instruments	Electrical Equip., Appliances and Components
Miscellaneous Manufacturing	Remaining Balance of Manufacturing
Non-manufacturing Industries:	
Crop Production	Agriculture Production - Crops
Other Agriculture, Forestry, Fishing & Hunting	Other Agriculture including Livestock
Coal Mining *	Coal Mining
Oil & Gas Extraction & Support Activities *	Oil & Gas Extraction
Other Mining & Quarrying	Metal & Other Non-metallic Mining
Construction	Construction

NEMS Macroeconomic Activity Module	NEMS Industrial Demand Module
Services:	
Transportation & Warehousing	NA
Broadcasting & Telecommunications	NA
Electric Power Generation & Distribution *	NA
Natural Gas Distribution *	NA
Water, Sewage & Related System	NA
Wholesale Trade	NA
Retail Trade	NA
Finance & Insurance, Real Estate	NA
Other Services	NA
Public Administration	NA

* Energy Sectors

Employment by Industry Model Overview

The employment model determines employment in fifty-nine industries and service sectors in the U.S. (see Table A12), consistent with the forecast of non-farm employment (EEA) from the macroeconomic model. Industrial output, relative factor prices and productivity and average workweek trends are the key determinates of industrial employment. Real outputs in the industries are from the industrial model. Productivity trends, average workweek trends, labor compensation, capital service cost determinants, other factor prices and cyclical variables are determined in the macroeconomic model.

The basic behavioral equations in the employment model are the total manufacturing employment (EMF) and unconstrained employment (XXX_E{ind}) equations for each of the detailed industries (ind). Employment is based upon production theory. Consistent with production theory, the key determinant of employment by industry is industrial output. Both current and lagged output values enter in the employment specification, reflecting the tendency of firms to hire employees in response to lagged output growth and to layoff employees in response to lagged output declines. The labor-to-output ratio varies with changes in relative factor prices, productivity, the national average workweek, cyclical factors and technological change. Relative factor prices are represented by labor cost, capital cost, energy and other factor prices and interest rates. National productivity trends and industry-specific time trends are used to capture changes in the employment-to-output relationship due to technological advances. Change in the average length of the workweek also alters this relationship. Some industries' workweek tends to increase relative to the national average with declines in the cyclical unemployment rate and with increases in manufacturing capacity utilization rates. Both factors cause industries to increase their utilization of existing labor.

Total Non-farm, Private Non-farm and Government Employment

Projections for total non-farm (EEA) and government federal and state and local employment (EG91 and EGSL) are established in the macroeconomic model. Private non-farm employment (EEAPIO) is determined by subtracting government employment from total non-farm employment.

EEAPIO = EEA - EG91 - EGSL

Manufacturing Employment

Changes in total manufacturing employment are directly proportional to current and lagged changes in manufacturing output and inversely proportional to increases in current and lagged manufacturing productivity and the average manufacturing workweek. Output is measured in 2000 dollars for all industries except two (see Chapter 3).

dlog(EMF * Mfg Productivity) – dlog(Mfg Output) =
A + B1 * dlog(@movavg(Mfg Productivity(-1), 15) / Mfg Productivity)
+ B2 * dlog(@movavg(Mfg Output(-1), 3) / Mfg Output)

Or alternatively,

dlog(EMF) =
A + (1 – B2) * dlog(Mfg Output) + B2 * dlog(@movavg(Mfg Output(-1), 3))
+ (1 – B1) * dlog(Mfg Productivity)
+ B1 * dlog(@movavg(Mfg Productivity(-1), 15))

Where:

EMF	= manufacturing employment
Mfg Output	= real dollar value of manufacturing output
Mfg Productivity	= labor productivity for the manufacturing sector, = JQPCMHM * HPMF
JQPCMHM	= index for output per hour in manufacturing
HPMF	= average weekly hours in manufacturing
and	
dlog(X)	= first difference of the logarithm, = log(X) – log(X(-1))
(@movavg(X,n)	= n-period backward moving average, = (X + … + X(-n+1)) / n

Employment in each manufacturing industry is first estimated independent of total manufacturing employment. Unconstrained manufacturing industry employment (XXX_E{ind}) is modeled as a function of current and lagged output, manufacturing productivity and average workweek, relative factor prices and such cyclical variables as the unemployment rate and capacity utilization rates (with the sum of the elasticities on current and lagged equal to 1.0).

dlog(XXX_E{ind} / (R{ind}R / Labor Productivity)) =
A + B1 * dlog(@movavg(Labor Productivity, lags) / Labor Productivity)
+ B2 * dlog(@movavg(R{ind}R, lags) / R{ind}R)
+ B3 * dlog(Relative factor prices)
+ B4 * d(Cyclical variable)

Where:

XXX_E{ind}	= employment of industry ind
R{ind}R	= real dollar value of output of industry ind
Labor Productivity	= labor productivity = JQPCMHMD * HPMD for durable manufacturing industries or JQPCMHMN * HPMN for non-durable manufacturing industries
JQPCMHMD(N)	= index for output per hour in durable (non-durable) manufacturing
HPMD(N)	= average weekly hours in durable (non-durable) manufacturing
Relative factor prices	= Ratio of labor compensation in non-farm business and relevant producer prices or energy prices (for energy-intensive industries)
and	
d(X)	= first difference = X - X(-1)
dlog(X)	= first difference of the logarithm, = log(X) – log(X(-1))
(@movavg(X,n)	= n-period backward moving average, = (X + … + X(-n+1)) / n

Unconstrained manufacturing employment (XXX_EMF) is defined by summing unconstrained employment across the manufacturing industries.

The difference between the manufacturing employment total computed in the first step (EMF) and this unconstrained total (XXX_EMF) is defined as EMRESID. Employment in each manufacturing industry (E{ind}) is set equal to its unconstrained employment plus a share of the EMRESID.

EMRESID = EMF - XXX_EMF

E{ind} = XXX_E{ind} + (XXX_E{ind} / XXX_EMF) * EMRESID

This process ensures that the sum of the detailed manufacturing industries align with the aggregate EMF. The value of EMRESID is within one percent of EMF, indicating that the alignment process does not distort the forecast results in any significant way.

Non-manufacturing Employment

Employment in each non-manufacturing industry or service sector is modeled in a two-step process similar to that for manufacturing industrial employment. That is, unconstrained non-manufacturing employment (XXX_E{ind}) is modeled as a function of current and lagged output, non-farm productivity and average workweek, relative factor prices, and such cyclical variables as the unemployment rate and capacity utilization rates (with the sum of the elasticities on current and lagged equal to 1.0).

dlog(XXX_E{ind} / (R{ind}R / (Labor Productivity))) =
A + B1 * dlog(@movavg(Labor Productivity, lags) / Labor Productivity)
+ B2 * dlog(@movavg(R{ind}R, lags) / R{ind}R)
+ B3 * dlog(Relative factor prices)
+ B4 * dlog(Cyclical variable)

Where:

XXX_E{ind}	= employment of industry or service sector ind
R{ind}R	= real dollar value of output of industry or service sector ind
Labor Productivity	= labor productivity = JQPCMHNF * HRNFPRI in general or JQPCMHM * HPMF for industries producing inputs for manufacturing industries
JQPCMHNF	= index for output per hour in non-farm business
HRNFPRI	= average weekly hours in non-farm business
JQPCMHM	= index for output per hour in manufacturing
HPMF	= average weekly hours in manufacturing
Relative factor prices	= Ratio of labor compensation in non-farm business and relevant producer prices or energy prices (for energy-intensive industries)

Unconstrained private non-farm employment (XXX_EEAPIO) is defined by summing unconstrained non-manufacturing employment by sector and total manufacturing employment.

The difference between total private non-farm employment and this unconstrained total (XXX_EEAPIO) is defined as EEAPRESID. Employment in each non-manufacturing industry (E{ind}) is set equal to its unconstrained employment plus a share of EEAPRESID.

EEAPRESID = EEAPIO - XXX_EEAPIO

E{ind} = XXX_E{ind} + EEAPRESID * (XXX_E{ind} / (XXX_EEAPIO - EMEMFG))

The value of EEAPRESID is within one percent of EEAPIO, indicating that raw results from the employment model match fairly well with the aggregated employment forecast from the macroeconomic model.

Total non-farm employment within the employment model (EEAIO) is defined as the sum of all employment other than agricultural employment. EEAIO should match the level of non-farm employment (EEA) derived in the macroeconomic model, except for rounding errors.

EEAIO = EMF + ENM + EMIN + E23 + EG91 + EGSL = EEA

Where:
EMF = manufacturing employment
ENM = sum of employment in the service sectors
EMIN = sum of employment in the mining sectors
E23 = employment in the construction sector
EG91 = federal employment
EGSL = state and local employment

Aggregation to the NEMS Sectors

As in the case of industrial output, employment forecasts are also aggregated into the NEMS categories. The classification for employment is the same as that for output (see Page 21), except that the public sector is further disaggregated into categories – Federal Government, and State and Local Government.

Among the five energy sectors, employment forecasts for coal mining and for oil and gas extraction are available from other NEMS Modules. Their forecast growth rates are applied to the historical data in place of the macroeconomic model forecast.

4. Energy Information Administration's Regional Models

Overview

Economic concepts beyond the national level are required in the NEMS demand modules. The level of regional detail is defined by the nine Census Divisions:

1. New England
2. Middle Atlantic
3. South Atlantic
4. East North Central
5. East South Central
6. West North Central
7. West South Central
8. Mountain
9. Pacific

A suite of regional models has been developed to provide the following concepts for each of the nine Census Divisions:

1. Macroeconomic variables – population, economic activity, prices and wages
2. Industry variables – output and employment by sector
3. Building variables – residential housing starts and commercial floorspace addition and stocks

The regional models are downstream models in the Macroeconomic Activity Module. That is, they are run after the national models, and there is no feedback mechanism to revise the national forecast based upon the regional results. Instead, an alignment process is introduced to scale the regional forecasts computed from the models so that the sum of the regional variables aligns to its respective national variable, if the latter exists in the national model. This "top-down" approach is adopted because only selected macroeconomic variables are covered in the regional models, and the national variables are used as explanatory variables. Without a complete regional economic framework, it is not appropriate to adopt a "bottom-up" approach for selected variables.

Detailed descriptions of the variables are listed in Tables A13-A15.

Detailed structural forms and coefficients for the regional models are presented in Appendix C.

Macroeconomic Variables

The following macroeconomic concepts are forecast for each of the nine Census Divisions:

1. Population
2. Population Aged 16 and Over
3. Real Gross State Product
4. Real Personal Disposable Income
5. Personal Income Tax
6. Personal Income Tax Rate
7. Personal Income
8. Wage and Salary Disbursements
9. Manufacturing and Non-manufacturing Wages
10. Consumer Price Index

Forecasts of the two population variables are based on population projections published by the U.S. Census Bureau. The other variables are forecast in the regional macroeconomic model. The regional model is a quarterly model with historical data beginning as early as 1970. It uses inputs from the U.S. model and supplies outputs to the regional industrial output and employment models as well as the commercial floorspace model.

Population

Forecasts of the population series are exogenous to the NEMS. For the AEO 2009, population forecasts are based upon the population *estimates* (2000 to 2004) and the population *projections* (through 2030) by state and by age as released in March and April 2005 respectively by the U.S. Census Bureau (source: http://www.census.gov/popest/datasets.html and http://www.census.gov/population/www/projections/projectionsagesex.html). The Census population projections were based upon an earlier population estimates, and so the 2004 data did not match the latest population estimates. Moreover, the aggregated state estimates did not match the national total from U.S. model, which includes armed forces stationed overseas.

To ensure consistency, the total population and population aged 16 and over by state through 2004 were compiled from the population estimates. A similar set was compiled for the population forecast. The forecast growth rates of the latter were applied onto the former to produce the preliminary forecast. The sum of the preliminary state forecast was then compared to the national total. Adjustments were then made to the state forecast so that they summed to the national total. The state series were then aggregated to the nine Census Divisions.

History through 2004:

$NP_i = \sum POP_E_{ij}$

$NP16Ai = \sum_{j>=16} POP_Eij$

2005 through 2030:

$NP_i = NP_i(-1) * \sum POP_F_{ij} / \sum POP_F_{ij}(-1)$

$NP16A_i = NP16A_i(-1) * \sum POP16A_F_{ij} / \sum POP16A_F_{ij}(-1)$

$NP_i = NP_i * NP / (\sum NP_i)$

$NP16A_i = NP16A_i * NP16A / (\sum NP16A_i)$

Where:

i	= individual state
j	= age by year, = 0, 1, 2, …
NP_i	= total state population
POP_E	= total population based on Census population estimates
POP_F	= total population based on Census population projections
NP	= total national population from Macroeconomic Model
$NP16A_i$	= population 16 and over by state
POP16A_E	= population 16 and over based on Census population estimates
POP16A_F	= population 16 and over based on Census population projections
NP16A	= total national population 16 and over from Macroeconomic Model

Gross State Product

Regional gross state product is in real per capita terms. The equations are in log form. There is an estimated equation for each of the nine Census Divisions. Explanatory variables include lags of own gross state product and national gross domestic product. The general form of the gross state product equations is:

$$\log(GSPRZNP_i/GDPRZN) = \sum b1_i * \log(GSPRZNP_i(-1)/ GDPRZN(-1)) + \sum b2_i * @movav(\log(GSPRZNP_i(-1)/ GDPRZN(-1)),3)$$

Where:

i	= 1 to 9 Census Divisions
$b1_1$, $b1_2$	= estimated coefficients for the explanatory variables in the equation for gross state product, regional
GDPRZN	= real per capita gross domestic product, billions of 2000 dollars, U.S.
$GSPRZNP_i$	= real per capita gross state product, billions of 1996 dollars, regional

Real gross state product data comes from the Regional Economic Accounts maintained by the Bureau of Economic Analysis. The historical gross state product data is at an annual interval beginning in 1986 and is measured in billions of 2000 dollars for all Census Divisions. Quadratic-match average is the method used in EViews to convert the frequency to quarterly from annual. The real gross domestic product data comes from Global Insight's model of the U.S. economy. Historical gross domestic product is at a quarterly interval beginning in 1959 and is measured in billions of chained 2000 dollars. Global Insight's source for real gross domestic product is the Bureau of Economic Analysis.

Total regional population including armed forces overseas comes from the Census Bureau. Historical regional total population is at an annual interval beginning in 1980. Quadratic-match average is the method used in EViews to convert the frequency to quarterly from annual. Total population comes from Global Insight's model of the U.S. economy. Its source is also the Census Bureau. Historical U.S. total population is at a quarterly interval beginning in 1959.

Income and Taxes

Regional disposable income is in real terms. Its equation is an identity in which nominal personal disposable income is deflated using a regional consumption deflator. There is an equation for each of the nine Census Divisions. The general form of the identity for real disposable income equations is:

$YPDR_i = YPD_i / ((JPC_{i,2006:3} / JPC_{2006:3}) * JPC)$
$JPC_i = YPD_i / YPDR_i$

Where:

i	= 1 to 9 Census Divisions
JPC	= consumption deflator, index – 2000=1.00, national
$JPC_{2006:3}$	= 2006:3 value of the consumption deflator, index – 2000=1.00, national
JPC_i	= consumption deflator, index – 2000=1.00, regional
$JPC_{i,2006:3}$	= 2006:3 value of the consumption deflator, index – 2000=1.00, regional
YPD_i	= disposable income, billions of dollars, national
$YPDR_i$	= real disposable income, billions of 2000 dollars, regional

A regional consumption deflator is computed for each Census Division. Its value in 2006:3 is used to compute a regional consumption deflator time series over the forecast horizon given growth of the national series. The historical regional consumption deflator is computed using Census Division level data for nominal and real disposable incomes. The source for the income data is Bureau of Economic Analysis. The historical data is at a quarterly frequency beginning in 1970. The nominal series is measured in billions of dollars. The real series is in billions of 2000 dollars.

Nominal personal disposable income is personal income less taxes. The regional tax rate is computed by applying the growth of the national rate to the regional rate beginning in the third quarter of 2006.

$YPD_i = YP_i * (1 – (TAXRATE_{i,2006:3} / TAXRATE_{2006:3}) * TAXRATE)$

Where:

i	= 1 to 9 Census Divisions
YP_i	= personal income, billions of dollars, regional
YPD_i	= disposable income, billions of dollars, regional
TAXRATE	= personal income tax rate, percent, national
$TAXRATE_{2006:3}$	= 2006:3 value of personal income tax rate, percent, national
$TAXRATE_{i,2006:3}$	= 2006:3 value of personal income tax rate, percent, regional

Personal income is the sum of wage and salary disbursements by government and by the private sector plus income from other sources.

$YP_i = YPCOMPWSD_i + YPOTH_i$

Where:

i	= 1 to 9 Census Divisions
YP_i	= personal income, billions of dollars, regional
$YPCOMPWSD_i$	= wage and salary disbursements, billions of dollars, regional
$YPOTH_i$	= other personal income, billions of dollars, regional

Other personal income for each of the Census Divisions is an identity. The current period's regional forecast is determined by the per capita growth of other personal income for the U.S.

$YPOTH_i = ((YPOTH_i(-1) / NP_i(-1)) * (YPOTH / NP) / (YPOTH(-1) / NP(-1))) * NP_i$

Where:

i	= 1 to 9 Census Divisions
NP	= total population including armed forces overseas, millions of persons, national
NP_i	= total regional population including armed forces overseas, millions of persons, regional
YPOTH	= other personal income, billions of dollars, national
$YPOTH_i$	= other personal income, billions of dollars, regional

Historical regional income data comes from Bureau of Economic Analysis. The historical income data is at a quarterly frequency beginning in 1970. Nominal series are measured in billions of dollars. Real series are measured in billions of 2000 dollars. National income data comes from Global Insight's model of the U.S. economy. Historical income is quarterly and begins in 1959. Its units are the same as those for regional income. Global Insight's source for income is the Bureau of Economic Analysis.

Total regional population including armed forces overseas comes from the Census Bureau. Historical regional total population is at an annual interval beginning in 1980. Quadratic-match average is the method used in EViews to convert the frequency to quarterly from annual. The regional population time series were extended back until the start of 1972 using historical data from Census Bureau. The national total population comes from Global Insight's model of the U.S. economy. Its source is also the Census Bureau. Historical U.S. total population is at a quarterly interval beginning in 1959.

The national personal income tax is the difference between personal and disposable incomes. The source for national personal and disposable incomes is Global Insight's model of the U.S.

economy. Historical personal and disposable incomes are at a quarterly interval beginning in 1959 and are measured in billions of dollars. Global Insight's source for personal and disposable incomes is the Bureau of Economic Analysis. The personal tax rate is the share of personal income paid in taxes. The historical regional tax rate is computed using the Census Division's personal and disposable incomes from Bureau of Economic Analysis. The historical data is at a quarterly frequency beginning in 1970 and is measured in billions of dollars for all Census Divisions.

$TAX = YP - YPD$
$TAXRATE = TAX / YP$

$TAX_i = YP_i - YPD_i$
$TAXRATE_i = TAX_i / YP_i$

Where:
i = 1 to 9 Census Divisions
TAX = personal income tax, billions of dollars, national
TAX_i = personal income tax, billions of dollars, regional
TAXRATE = personal income tax rate, percent, national
$TAXRATE_i$ = personal income tax rate, percent, regional
YP = personal income, billions of dollars, national
YP_i = personal income, billions of dollars, regional
YPD = disposable income, billions of dollars, national
YPD_i = disposable income, billions of dollars, regional

Wage and Salary Disbursements

Regional wage and salary disbursements are the sum of government and private sector disbursements. Units are billions of dollars. There is an equation for each of the nine Census Divisions:

$YPCOMPWSD_i = YPCOMPWSDG_i + YPCOMPWSDP_i$

Where:
i = 1 to 9 Census Divisions
$YPCOMPWSD_i$ = wage and salary disbursements, billions of dollars, regional
$YPCOMPWSDG_i$ = wage and salary disbursements by government, billions of dollars, regional
$YPCOMPWSDP_i$ = wage and salary disbursements by private sector, billions of dollars, regional

The regional wage and salary disbursement by government is total government disbursements shared by regional population:

$YPCOMPWSDG_i = YPCOMPWSDG * NP_i / NP$

Where:

i	= 1 to 9 Census Divisions
NP	= total population including armed forces overseas, millions of persons, national
NP_i	= total regional population including armed forces overseas, millions of persons, regional
YPCOMPWSDG	= wage and salary disbursements by government, billions of dollars, national
$YPCOMPWSDG_i$	= wage and salary disbursements by government, billions of dollars, regional

The regional wage and salary disbursement by the private sector is determined by the rate of growth of the employment cost index of private sector wages and salaries:

$$YPCOMPWSDP_i = b1_i * (((JECIWSP * MHRSNFP) / (JECIWSP(-1) * MHRSNFP(-1)) * (YPCOMPWSD_i(-1) - YPCOMPWSDG_i(-1)) + (JECIWSP(-1) * MHRSNFP) / (JECIWSP(-2) * MHRSNFP(-1)) * (YPCOMPWSD_i(-1) - YPCOMPWSDG_i(-1))) / 2)$$

Where:

i	= 1 to 9 Census Divisions
$b1_i$	= estimated coefficient for the explanatory variable in the equation for wage and salary disbursements by the private sector, regional
JECIWSP	= employment cost index, private sector wages and salaries, Dec. 2005 = 1.0, national
MHRSNFP	= man-hours in private non-farm establishments, billions of hours, national
$YPCOMPWSD_i$	= wage and salary disbursements, billions of dollars, regional
$YPCOMPWSDG_i$	= wage and salary disbursements by government, billions of dollars, regional
$YPCOMPWSDP_i$	= wage and salary disbursements by private sector, billions of dollars, regional

Historical regional wage and salary disbursements data comes from Bureau of Economic Analysis. The historical disbursements data is at a quarterly frequency beginning in 1970 and is measured in billions of dollars for all Census Divisions. National wage and salary disbursements data comes from Global Insight's model of the U.S. economy. Historical disbursements data is at a quarterly interval beginning in 1959 and is measured in billions of dollars.

Data for the national employment cost index for private sector wages and salaries comes from Global Insight's model of the U.S. economy. Historical data begins in the first quarter of 1975. The original source of the employment cost index is the Bureau of Labor Statistics. The time

series for man-hours in private non-farm establishments begins in the first quarter of 1964. This data also originates from the Bureau of Labor Statistics.

Total regional population including armed forces overseas comes from the Census Bureau. Historical regional total population is at an annual interval beginning in 1980. Quadratic-match average is the method used in EViews to convert the frequency to quarterly from annual. The regional population time series were extended back until the start of 1972 using historical data from Census Bureau. The national total population comes from Global Insight's model of the U.S. economy. Its source is also the Census Bureau. Historical U.S. total population is at a quarterly interval beginning in 1959.

Manufacturing and Non-manufacturing Wages

Regional average annual manufacturing wages are in nominal terms. The equations are in log form. There is an estimated equation for each of the nine Census Divisions. The explanatory variable is the employment cost index for private sector wages and salaries. The general form of the average annual manufacturing wages equations is:

$$dlog(RWM_i) = b1_i * dlog (JECIWSP*RWM_{i,1992})$$

Where:

i	= 1 to 9 Census Divisions
$b1_i$	= estimated coefficient for the explanatory variable in the equation for average annual manufacturing wages in Census Division i
JECIWSP	= employment cost index for private sector wages and salaries, 1992=1.0, national
RWM_i	= average annual manufacturing wages, thousands of dollars, regional

Historical, regional, average annual manufacturing wage data comes from Bureau of Economic Analysis. The historical wage data is at a quarterly frequency beginning in 1970 and is measured in thousands of dollars for all Census Divisions. The employment cost index for private sector wages and salaries comes from Global Insight's model of the U.S. economy. The historical employment cost index is at a quarterly interval beginning in 1975 and is an index with 1992 = 1.0.

Regional average annual non-manufacturing wages are in nominal terms. The equations are in log form. There is an estimated equation for each of the nine Census Divisions. The explanatory variable is the employment cost index for private sector wages and salaries. The general form of the average annual non-manufacturing wages equations is:

$dlog(RWNM_i) = b1_i * dlog (JECIWSP*RWNM_{i,1992})$

Where:

i	= 1 to 9 Census Divisions
$b1_i$	= estimated coefficient for the explanatory variable in the equation for average annual manufacturing wages in Census Division i
JECIWSP	= employment cost index for private sector wages and salaries, 1992=1.0, national
$RWNM_i$	= average annual non-manufacturing wages, thousands of dollars, regional

Historical regional average annual non-manufacturing wage data comes from Bureau of Economic Analysis. The historical wage data is at a quarterly frequency beginning in 1970 and is measured in thousands of dollars for all Census Divisions. The index of total compensation in non-farm business comes from Global Insight's model of the U.S. economy. The historical total compensation is at a quarterly interval beginning in 1959 and is an index with 1992 = 1.0.

Consumer Price Index

There is an identity for each of the nine Census Divisions to compute a regional consumer price index. The base year for the index is 1982-84 = 1.0. The equation for the consumer price index is:

$CPI_i = CPIZ_i * CPI$

Where:

i	= 1 to 9 Census Divisions
CPI	= consumer price index, all urban, 1982-84=1.0, national
CPI_i	= consumer price index, all urban, 1982-84=1.0, regional
$CPIZ_i$	= regional consumer price index relative to national, 2003:4 value, regional

For each Census Division, a regional consumer price index relative to the national index is computed. The 2006:3 value of this series is the constant used to compute a regional consumer price index over the forecast horizon given growth in the national index. The source for the historical regional and national consumer price indices is Bureau of Labor Statistics. The historical data is at a quarterly frequency beginning in 1970 and equals 1.0 in the first quarter of 1980 for all Census Divisions. The source for the national consumer price index is Global Insight's model of the U.S. economy. The historical index is at a quarterly interval beginning in

1959, and the average of the index from 1982 to 1984 is 1.0. Global Insight's source for the consumer price index is the Bureau of Labor Statistics.

Industry Variables

The industry block of the Regional Model forecasts values of output and employment for thirty-five industrial sectors and ten service sectors for each of the nine Census Divisions. Table A14 lists the descriptions of the sectors and the corresponding North American Industry Classification System (NAICS) codes.

Historical value of shipments and employment data for the manufacturing sectors are from the Economic Census databases and Annual Survey of Manufacturing databases purchased from the U.S. Bureau of the Census. As for the non-manufacturing and service sectors, gross state product and employment data from the U.S. Bureau of Economic Analysis (http://www.bea.gov/regional/rims/) are used to supplement the value of output and employment data from the Economic Census, which covers all sectors.

Output

The historical regional output data are in nominal terms. Converting them to real terms (that is, in constant 2000 dollars as in the national industry model) requires sectoral price information at the region level, which are not available to EIA. An alternative solution was used to compute the real value series using the nominal regional shares:

$$\text{Real Output Value}_{ir} = \frac{\text{Nominal Output Value}_{ir}}{\sum_{r} \text{Nominal Output Value}_{ir}} * \text{Real Output Value}_{iUS}$$

Where:
i = industrial or services sector
r = region (9 Census Divisions)

This implicitly assumes that the producer price indexes for the regions are the same as that for the nation in each sector.

The sectors are analyzed separately, in a pooled cross-sectional time-series framework. The regions are the members of the pooled variables. One equation is created for each sector, with the variables for all the nine Census Divisions serving as endogenous and explanatory variables. This allows the choice of estimating a common coefficient for an explanatory variable across all regions or having cross-section specific coefficients that are different for each region.

For each sector, the endogenous variable is the regional output share (the denominator, national output, is predetermined). The explanatory variables are the regional shares of macroeconomic variables (or the ratio of the regional to the national variable), national macroeconomic variables and time trend. The general structural form is:

$$d(output_{rxt}/output_{USxt}) = a_{rx} + b_{1x}*(@mean(output_{rxt}/output_{USxt},"1980\ 2001")-(output_{rx\ t-1}/output_{USxt-1})) + b_{2x}*d(output_{rxt-1}/output_{USxt-1}) + b_{3x}*d(gspr_{rt}/np_{rt}) + b_{4x}*d(rmprime_{USt}-@pca(cpi_{rt})) + b_{5x}*d(wpi05_{rt}/jpgdp_{USt}) + b_{6x}*d(rw_{rt}/jpgdp_{USt}) + b_{7x}*d(eea_{USt}) + b_{8x}*@trend$$

Where:

r	= region (9 Census Divisions)
x	= manufacturing (ind1 to ind29), non-manufacturing (ind30 to ind35) and services (ser1 to ser10) industries
t	= time
output	= value of shipments in region r or for the US for good or service x at time t, billions of real 2000 dollars
gspr	= real gross state product aggregated for region r at time t, billions of real 2000 dollars
np	= population in region r at time t, millions of persons
rmprime	= prime rate at national banks at time t, percent per annum
cpi	= consumer price index, all urban at time t, 1982-84 = 1.00
wpi05	= producer price index for fuels, related products and power in region r at time t, 1982 = 1.0
rw	= annual average manufacturing (rw=rwm) or non-manufacturing (rw=rwnm) wages in region r at time t, thousands of dollars
jpgdp	= chained price index for gross domestic product at time t, 2000 = 1.0
eea	= employment, total nonfarm payrolls, millions of persons
@trend	= time trend

The rationale of the relation is that while regional output may follow the national trend, it is also affected by the region's relative advantages in size of economy, affluence, production cost, labor force availability, sensitivity to energy prices and capability/flexibility to adopt new technology and other changes, represented by a time trend variable. Not all of these variables are significant in every sector or within every Census Division, but in total they all have a substantial impact on a region's production activities. Understandably, the regional forecast from the estimated equations does not add up to the national total. An alignment procedure is used to scale the preliminary forecast so that their sum aligns with the national total.

Employment

A set of pooled cross-sectional time-series regressions is developed to forecast regional employment by sector. The general structural form for private sector employment is:

$$\begin{aligned}\text{dlog}(\text{employment}_{rxt}/\text{rev}_{rxt}/(\text{jqpcmh}n_t*\text{hp}n_t)) = a_{rx} \\ &+ b_{1x}*\text{dlog}(@\text{movav}(\text{rev}_{rxt-1},2)/\text{rev}_{rxt}) \\ &+ b_{2x}*\text{dlog}(@\text{movav}(\text{jqpcmh}n_{t-1}*\text{hp}n_{t-1},2)/(\text{jqpcmh}n_t*\text{hp}n_t) \\ &+ b_{3x}*\text{d}(\text{utlb00004}_t) \\ &+ b_{4x}*\text{dlog}(\text{jwssnf}_t/\text{wpi05}_{rt})) \\ &+ b_{5x}*\text{d}(\text{ruc}_t) \\ &+ b_{6x}*\text{dlog}(\text{sp500}_t/\text{gspr}_{rt}) \\ &+ b_{7x}*\text{dlog}(\text{wpi}m_{rt}/\text{jpgdp}_t) \\ &+ b_{8x}*@\text{trend}\end{aligned}$$

Where:

r	= region (9 Census Divisions)
x	= manufacturing (ind1 to ind29), non-manufacturing (ind30 to ind35) and services (ser1 to ser11) industries
t	= time
m	= producer price indexes for farm products (01); fuels, related products and power (05); refined petroleum products (057); residual petroleum fuels (0574); chemicals and allied products (06); pulp, paper and allied products (09); machinery and equipment (11); furniture and household durables (12); and for finished goods (SOP3000)
n	= manufacturing (M or MF), durable manufacturing (MD), nondurable manufacturing (MN) and nonfarm manufacturing (NF)
employment	= employment in region r for good or service x at time t, millions of persons
rev	= value of shipments in region r for good or service x at time t, billions of real 2000 dollars
jqpcmh*n*	= output per hour in manufacturing (M), durable manufacturing (MD), nondurable manufacturing (MN) and nonfarm business (NF) at time t, 1992 = 1.0
hp*n*	= average weekly hours in durable manufacturing (MD), manufacturing (MF) and nondurable manufacturing (MN) at time t, hours
utlb00004	= factory operating rate, manufacturing at time t, percent
jwssnf	= total compensation in nonfarm business at time t, 1992=1.0
wpi*m*	= producer price index for fuels, related products and power in region r at time t, 1982=1.0
ruc	= civilian unemployment rate at time t, percent
sp500	= S&P 500 index of common stocks at time t, index
gspr	= gross state product in region r at time t, billions of real 2000 dollars
jpgdp	= chained price index for gross domestic product at time t, 2000=1.0
@trend	= time trend

The main explanatory variable is regional output. However, historical data indicate that output per employee is not the same across regions. Labor cost affects employment decisions. Employment for selected service sectors (distributional trade and business and personal services) is likely to depend on the region's economic activities. A time trend variable is included in some sectors to capture differences in adoption of technology and other productivity improvements. A two-year moving average of the explanatory variable is adopted to reflect the lagged effect in hiring. As in the case of output, the preliminary employment forecasts are also scaled so that their sum aligns with the national total for each sector.

Building Variables

Other regional variables required by the NEMS Demand Modules are housing starts and commercial floorspace stocks.

Housing Starts:

1. Single Family Housing Starts
2. Multi-Family Housing Starts
3. Mobile Home Shipments

Commercial floorspace (thousand square feet) types:

1. Stores – stores and restaurants
2. Warehouse – manufacturing and wholesale trade, public and federally-owned warehouses
3. Office – private, federal, and state and local offices
4. Automotive – auto service and parking garages
5. Manufacturing
6. Education – primary/secondary and higher education
7. Health – hospitals and nursing homes
8. Public – federal and state and local
9. Religious
10. Amusement
11. Miscellaneous, non-residential – transportation related and all other not elsewhere classified
12. Hotel – hotels and motels
13. Dormitories – educational and federally-owned (primarily military)

Housing Starts

The regional residential housing forecast for single and multi-family housing starts and for mobile home shipments are done using shares supplied by the NEMS's Residential Module manager. The shares are derived from annual changes in regional population relative to that for the nation. Population is an exogenous assumption in all the MAM models. Starts and shipments are measured in millions of units. Beginning in 2002, there is an annual share value for single and for multi-family housing starts as well as for mobile home shipments in each of the nine Census Divisions. The shares are applied to the respective national total from Global Insight's model of the U.S. economy. Historical data for housing starts and mobile home shipments are quarterly and begin in 1959. The Census Bureau is Global Insight's source for single-family starts and mobile home shipments. Global Insight constructs multi-family housing starts. Since the frequency of the shares is annual and that for Global Insight's U.S. and EIA's regional models are quarterly, the shares are converted to a quarterly frequency. Constant-match average is the method used in EViews to convert the frequency to quarterly from annual.

Commercial Floorspace

The COMFLR sub-module of the MAM contains two hundred and eighty equations of which thirteen (thirteen commercial floorspace types) are national floorspace additions estimated using historical data beginning in the seventies. The remaining two hundred and sixty-seven equations are identities. Of the identities, one hundred and seventeen share the national additions by floorspace type to the regional level using a share which is a twenty quarter moving average. Another one hundred and seventeen equations compute regional stocks by floorspace type by adding net additions to last period's existing stock. A related thirteen identities sum regional stocks by floorspace type to compute national stocks by floorspace type. The final twenty identities aggregate additions and stocks by region (nine Census regions) and then aggregate these regional sums for national totals of additions and of stocks. The sub-module forecasts both the additions and stocks of thirteen floorspace types in each of the nine Census Divisions. The units are thousand square feet of commercial floorspace at a quarterly interval. The quarterly additions are aggregated and the resulting annual stock solution is written to the NEMS common block as the reported annual floorspace forecast.

The commercial floorspace model is a stock adjustment model. The endogenous variable is the change in the addition of commercial floorspace in thousand square feet by floorspace type. The explanatory variables include lagged values of own commercial floorspace additions and stocks, trends of own commercial floorspace additions and stocks, per capita real gross domestic product, real per capita consumption of goods and services, real private investment in commercial buildings, real change in the stock of business inventories, employment, interest rates and total additions to national floorspace. The general form of the estimated commercial floorspace equations is:

$$
\begin{aligned}
d(comflr_flw_{it}) = \; & a_i \\
& + b1_i * d(comflr_flw_trend_{it}\text{-}comflr_flw_{it}(-1)) \\
& + b2_i * d(comflr_stk_trend_{it}\text{-}comflr_stk_{it}(-1)) \\
& + b3_i * d(gdpr_t/np_t) \\
& + b4_i * d(consr_t/np_t) \\
& + b5_i * d(ifnrescml_t/jpifnresc_t) \\
& + b6_i * d(iir_t) \\
& + b7_i * d(eea_t) \\
& + b8_i * d(rmcorpaaa_t) \\
& + b9_i * d(comflr_flw_t(-1))
\end{aligned}
$$

Where:

i	= 1 to 13 commercial floorspace types
a_i	= estimated constant for commercial floorspace i
$b1_i$, etc.	= estimated coefficients for the explanatory variables in the equation for commercial floorspace i
t	= time
$comflr_flw_trend_i$	= long-term trend of additions to commercial floorspace i, thousand square feet
$comflr_flw_i$	= additions to commercial floorspace i, thousand square feet
$comflr_stk_trend_i$	= long-term trend of stock of commercial floorspace i, thousand square feet
$comflr_stk_i$	= stock of commercial floorspace i, thousand square feet
gdpr	= real gross domestic product, billions of chained 2000 dollars
consr	= real consumer spending on all goods and services, billions of chained 2000 dollars
np	= total population including armed forces overseas, millions of persons
ifnresml	= private investment in commercial buildings, billions of dollars
jpifnresc	= chained price index – nonresidential construction – commercial and health care, 2000 = 100
iir	= real change in stock of business inventories, billions of chained 2000 dollars
eea	= employment – total nonfarm payrolls, millions of persons

rmcorpaaa	= yield on Aaa-rated corporate bonds
comflr_flw	= additions to total commercial floorspace, thousand square feet

Part B
THE MAM INTERFACE WITH THE NEMS

5. Integrated Simulations Using The MAM

This section first describes the types of integrated simulations of the Macroeconomic Activity Module (MAM) within the National Energy Modeling System (NEMS), followed by a discussion that briefly lays out the setup of the models constituting the MAM and the aspects that are common to all the simulations. As indicated above, the set of models is designed to run in a recursive manner. EIA's version of Global Insight's model of the U.S. economy, the macroeconomic model, provides forecasts of over 1700 concepts spanning final demands, aggregate supply, prices, incomes, international trade, industrial detail, interest rates and financial flows. The industrial output model takes the final demand projections from the macroeconomic model as inputs to provide projections of output for sixty sectors, covering the entire economy, at the three and sometimes four-digit NAICS code levels. The employment model takes the industrial output projections from the industry model and national wage rates, productivity trends and average workweek trends from the macroeconomic model to project employment in fifty-nine industries. The sum of non-farm employment is constrained to sum to the national total projected by the U.S. model. The regional model shares the national results of output and employment to the nine Census Divisions. The commercial floorspace model calculates regional floorspace for thirteen types of use by Census Division.

Integrated Simulations of Alternative Energy Conditions or Events

Integrated forecasts of the NEMS center on estimating the state of the energy-economy system under a set of alternative energy conditions. Typically, the forecasts fall into the following four types of integrated NEMS simulations:

1. Reference case projection
2. Alternative world oil prices
3. Changes in or proposed energy fees or emissions permits
4. Proposed changes in Combined Average Fuel Economy (CAFE) standards

In these integrated NEMS simulations, forecast values for over two hundred and forty macroeconomic and demographic variables from MAM are passed to NEMS. After making any requisite transformations required by the simulation, the modules of NEMS solve for demand, supply and prices of energy over the forecast period. These energy prices and quantities are then returned to MAM and a new forecast, Scenario 1, is solved in the MAM's U.S., industrial output,

employment by industry, regional and commercial floorspace models. Details of each type of integrated simulation are discussed below.

Reference Projection: The development of the MAM's reference case is an iterative process requiring many integrated simulations of the NEMS before global convergence is attained. But before the first integrated run can be done, it is necessary to create a baseline for the U.S. model. Modifications are made to Global Insight's model of the U.S. economy so that it includes EIA's assumption about the path of the world oil price. The results of this model solution become the preliminary baseline, Scenario 0, of the U.S. model.

At this point, the MAM is included in integrated simulations of the NEMS. Energy market conditions as supplied by the modules of the NEMS are assumptions exogenous to the U.S. model. The U.S. model is simulated using these assumptions. The resulting forecast is labeled "Scenario 1" in the EViews workfile. The MAM is a collection of models, with the U.S. model being the first to execute. Models of industrial output and employment by industry at the national level are solved sequentially using the U.S. model forecast. Simulations of regional models of economic activity, housing starts, commercial floorspace and of industrial output and employment by industry then follow. Once all the models of the MAM are solved, a subset of the forecast is written to the global data structure so that the modules of NEMS can react to these new economic assumptions. This is a "cycle" of the NEMS. Cycles are repeated until convergence factors are satisfied. At some point, following many runs of the NEMS, the reference case is declared to be frozen. The "Scenario 1" solution in the U.S. model then becomes the final baseline used as the starting point for analyzing policy proposals and changes in energy markets. These results are reported in the Annual Energy Outlook as the reference case.

Alternative World Oil Prices: Crude oil prices are determined in the international market and are influenced by production decisions in OPEC and non-OPEC nations. Two simulations are normally performed in conjunction with the reference forecast for the Annual Energy Outlook. These are based on a high oil price scenario and a low world oil price scenario. These high and low prices are based on different assumptions about the world's liquid market. For each of these cases, the MAM starts from the reference case, as explained above, and passes the values of the required macro variables to the modules of NEMS. The NEMS reacts to the alternative world oil price and various measures of economic activity. A new set of energy variables, including new oil prices, are passed back to the MAM, which then re-solves its series of models.

Changes in or Proposed Energy Taxes or Emission Permits: This class of simulations levies some kind of tax on an energy sector. It could be a per-unit tax (x-cents per gallon) or an ad-valorem tax (x% of revenues). It could be a tax on a fuel by type or on emissions by type. Since taxes are levied on an industry, prices are expected to rise in proportion to the tax. These taxes, if collected by the federal government, will change the budget deficit relative to the baseline. Since these taxes are not levied for revenue raising purposes, although the raising of revenue has also been considered in previous years, assumptions are made as to how these are returned to the

economy. Generally, three alternative schemes are implemented. First, it can be assumed that taxes are retained within the business sector (grandfathered). Second, they can be returned to households. Third, a fraction can be returned to the households while the remaining fraction is retained within the business sector. In practice, these alternative schemes have also included spending on government research and development projects as well as transfers to help ameliorate the impacts of the tax.

The grandfathered case is easiest to implement since the revenues stay in the business sector. Here, as in all simulations, reference scenario values for macroeconomic and demographic variables are passed to the NEMS. With increases in or introduction of new energy taxes, energy prices rise and quantities fall in the NEMS. These newly forecasted values are returned to the MAM. The increase in federal revenues due to energy taxes is also returned to the MAM. In this case the business sector retains all tax revenues.

In the case where revenues are returned to the consumers, the increased revenues are subtracted from corporate profits before taxes (ZB) by increasing Federal excise tax accruals other than for a value added tax (TXIMGFOTH) through the add factor associated with it (TXIMGFOTH_A). Second, the add factor associated with federal personal tax receipts (TXPGF_A) is either reduced by the same amount as the increase in the excise tax. Essentially these two procedures imply that the federal government takes the energy tax revenues away from the business sector as a lump sum amount and then returns them to consumers in the form of a lump sum.

In the case where a portion of the tax revenue is allowed to stay in the business sector and the remaining amount is returned to consumers, the add factor for TXIMGFOTH is increased by the amount that has to be returned to the consumers. Then the add factor for TXPGF is reduced by the same amount.

Proposed Changes in CAFE Standards: This class of simulations is based on changing (improving) the combined average fuel economy of new light vehicles relative to the baseline CAFE standards. Increases in the CAFE standards are associated with an increase in the cost of production of new light vehicles, which are calculated by the Transportation Module of the NEMS. This increased cost is passed to the MAM. The additional cost per new light vehicle is added to the reference average price of new light duty vehicles (PLVAVG).

Once the MAM solves its series of models using the new assumption, it writes its new forecast to the global data structure. The other modules of the NEMS read the new MAM and CAFE assumptions and solve. The resulting changes in energy prices and quantities along with the incremental cost for new light vehicles, are returned to the MAM. The MAM uses the newly forecasted energy market assumptions to re-solve. This process continues until the NEMS forecast converges.

Model Levers and Simulation Rules

Global Insight provides a series of levers and simulation tools in its models that permit change in key assumptions. All these levers and simulation rules are presented below along with a discussion of how they are modified in the MAM.

Energy Prices and Quantities: The projected values for energy prices and quantities appearing in the MAM's U.S. model are exogenous assumptions provided by the supply and demand modules of the NEMS. Similarly, forecasts of output for five energy-related industries and of employment in two energy-related industries are determined by the NEMS. The forecasted values of the following energy variables are exogenous to the MAM and are determined in the supply and demand modules of the NEMS:

a. Production of Energy

ENGDOMPETANG = Domestic production of petroleum & natural gas
ENGDOMO = Domestic production of energy excluding petroleum & natural gas

b. End-use Demand for Energy

DALLFUELS = Demand for all fuels
DENDUCOAL = End-use demand for coal (excludes electricity generation)
DENDUELC = Sales of electricity to ultimate consumers
DENDUNG = End-use demand for natural gas
DENDUPET = End-use demand for petroleum

c. Consumer Spending on Energy

CNEFACR = Real consumer spending on fuel oil & coal
CSVHOPGR = Real consumer spending on natural gas
CSVHOPER = Real consumer spending on electricity
CNEGAOR = Real consumer spending on gasoline & motor oil
QGASASF = Highway consumption of gasoline & special fuels

d. Prices of Energy

JPCNEFAC = Chained price index--consumer fuel oil & coal
JPCSVHOPE = Chained price index--household electricity
JPCSVHOPG = Chained price index--household natural gas
JPCNEGAO = Chained price index--consumer gasoline & oil
WPI051 = Producer price index--coal
WPI053 = Producer price index--gas fuels
WPI054 = Producer price index--electric power
WPI055 = Producer price index--utility natural gas
WPI0561 = Producer price index--crude petroleum
WPI057 = Producer price index--refined petroleum products

WPI0574 = Producer price index--residual petroleum fuels
POILIMP = Weighted average price of imported crude received in refinery inventories
POILWTI = Average price of light, sweet crude oil delivered to Cushing, OK (the delivery specifications for the NYMEX crude oil futures – often referred to as West Texas Intermediate)

e. Industrial Production Indices
IPSN2121 = Industrial production index--coal mining
IPSG211A3 = Industrial production index--oil & gas extraction & support activities

f. Industry Output
Though the output forecasts of the following energy-related industries are endogenously determined in the MAM's industrial output model, its values are overwritten. The MAM's forecasts are computed by applying the growth rates from the NEMS forecasts to the last historical data point in the MAM's industrial output model.

R2121R = Real Output of Coal Mining
R211R and R213R = Real Output of Oil and Gas Extraction and Support Activities
R32411R = Real Output of Petroleum Refining
R2211R = Real Output of Electric Utilities
R2212R = Real Output of Gas Utilities

g. Employment
Though the employment forecasts of the following energy-related industries are endogenously determined in the MAM's employment model, its values are overwritten. The MAM's forecasts are computed by applying the growth rates from the NEMS forecasts to the last historical data point in the MAM's employment model.

E2121 = Employment of Coal Mining Sector
E211 and E213 = Employment of Oil & Gas Extraction Sector

Fiscal Policy Assumptions: Unless mentioned otherwise, the MAM retains Global Insight's default settings for fiscal policy levers and assumptions.

a. Federal Purchases
Real federal government spending for each spending category is an exogenous input in the model. The price deflator associated with each of the goods categories reflects goods inflation in the private sector of the economy. Price deflators associated with the federal wage categories (JPGFMLCWSS and JPGFOCWSS) are closely tied to legislated pay increases; this pay increase concept explains 70-80% of the inflation in government wages while wage inflation in the private sector of the economy explains the remainder.

The determination of federal government pay increases (GFMLPAY and GFOPAY) is controlled by model lever GFPAYLEV. If GFPAYLEV is set to 1, federal government pay increases are specified exogenously by the model user (they should supply values for exogenous variables GFMLPAYEXO and GFOPAYEXO that are annual percent pay increases for the two categories respectively). If GFPAYLEV is set to 0, federal government pay increases are modeled to rise with inflation as indicated by the chained price index of consumer purchases (JPC). The default value for GFPAYLEV is 1.0.

b. Federal Transfer Payments

The model lever JSSLEV allows users to simulate Congressional decisions to trim (negative annual percentage rate) or augment (positive annual percentage rate) the cost-of-living adjustment (COLA) on social security payments (YPTRFGFSISS) based upon CPI inflation. For example, setting the lever value to 1 increases the social security COLA by 1%. The default value for JSSLEV is 0.

c. Personal Income Tax Rates

Tax rates in the model are largely exogenous at the federal level and endogenous at the state and local level. However, the model lever TXINFLEV allows the user to raise personal income tax rates if consumer prices rise. If TXINFLEV is set to 0, changes in the federal personal income tax rate (RTXPGF) are controlled through the add factor RTXPGF_A. If TXINFLEV is set to 1, the tax rate is indexed to CPI inflation. The default value for TXINFLEV is 1. The add factor RTXPGF_A can be used to target search the full employment federal budget surplus (NETSAVGFFE).

Monetary Policy Assumptions: The model lever RMFFLEV gives the user the flexibility of using the supply of reserves as the key monetary policy instrument, reflecting the Federal Reserve's open market purchases or sales of Treasury securities, or of using a reaction function as the policy instrument. If RMFFLEV is set to 0, the model uses non-borrowed reserves as the monetary policy instrument and the federal funds rate is determined by the balance between the demand and supply of reserves existing in the banking system (equation RMFFRES). The Federal Reserve does not engage in an active policy to stabilize the economy. The federal funds rate is determined by the demand for federal funds existing in the banking system. If the lever is set to 1, the model uses a Federal Reserve reaction function. This is an econometrically estimated equation which models the past behavior of the Federal Reserve in setting the federal funds rate in response to changes in inflation and unemployment (equation RMFFRCT). This implies that the Federal Reserve targets interest rates trading off changes in inflation and the unemployment rate.

In the baseline forecast of Global Insight's model of the U.S. economy, both the RMFFRES equation and the RMFFRCT equation yield the same federal funds rate forecast. Therefore, setting the lever at any value will not alter these baseline projections. For policy simulations, setting the value anywhere between 0 and 1 reflects the model user's view about the degree of active monetary policy undertaken by the Federal Reserve. In the simulations described above

the lever is set at 0.9 to allow for a fairly active monetary policy. This reflects the view that the Federal Reserve will act quickly to stabilize the economy in the case of energy events that have the potential to disrupt the economy significantly.

Foreign Assumptions: In general, Global Insight's default values are used. Exceptions are discussed below.

a. Interest Rates

The long-term government bond yield in rest-of-world industrial economies (RMGBLMTP) is exogenous and equal to its baseline value RMGBLMTPB if the model lever RMGBLMTPLEV is set to 0. If RMGBLMTPLEV is set to 1, this rate changes by the same amount as the rate on the 10-year U.S. Treasury note. If it is assumed that there is international monetary policy coordination between the United States and the other major industrial economies, then RMGBLMTPLEV should be set to 1. The default value for this lever is 0. This setting indicates that the interest rate differential between the U.S. and the rest-of-world industrial economies may differ.

b. Foreign Prices

Export and import demands are highly sensitive to changes in U.S. prices relative to foreign prices. While U.S. prices are modeled in considerable detail with a high level of sophistication, the prices of our major trading partners are largely exogenous assumptions in the model. At times, policy or event-related simulations can cause relative (U.S./foreign) prices to deviate significantly from baseline when foreign prices are fixed, causing trade volumes to respond strongly. In the case of a carbon tax that impacts our major trading partners to equal degrees, for example, relative prices should not be changing. Hence simple simulation rules have been added to the model that allow movements in the foreign prices relative to baseline levels.

b.1. Producer Prices and Relative Prices.

The model lever TRADEPLEV was introduced in order to negate any changes in relative prices on export and import demands. When TRADEPLEV is set to 1, export and import demands are determined by foreign output demand and relative (U.S./trading partner) prices. When TRADEPLEV is set to 0, relative prices are assumed to remain at baseline levels; export and import demands change from baseline levels only in response to changes in output, not relative prices. The default value for TRADEPLEV is 1.

The producer price index for the rest of the industrialized world (WPIWMTP) is both the key determinant of import prices and the key foreign price driving the U.S. exchange rate with industrialized countries. WPIWMTP is determined by one of two simulation rules based upon the value of the model lever WPIWLEV. If WPIWLEV is set to 0, foreign producer prices are changed relative to baseline levels with changes in imported oil prices (JPMGPET), U.S. merchandise export prices (JPXGXCPP), exchange rates (JEXCHMTP) and foreign economic activity (JGDPMTPR and JGDPOITPR). If WPIWLEV is set to 1, foreign producer prices move in line with U.S. merchandise export prices. The default value for WPIWLEV is 0.

b.2. Exchange Rates.
There are two nominal exchange rates in Global Insight's model of the U.S. economy. These are JEXCHMTP and JEXCHOITP and are defined as trade-weighted exchange rates (in U.S. $) for industrialized countries and for developing countries, respectively. In the MAM, these variables are set exogenously to their baseline projected values for all simulations.

c. Foreign GDP
There are two foreign real GDP variables in the macroeconomic model. These are real GDP in the rest of the industrialized world (JGDPMTPR) and real GDP in developing countries (JGDPOITPR). If the model levers corresponding to JGDPMTPR and JGDDPOITPR (JGDPMTPRLEV and JGDPOITPRLEV, respectively) are set to 0, they are exogenous. When JGDPMTPRLEV and JGDPOITPRLEV equals 1, both foreign real GDP concepts change in the same proportion as U.S. real GDP changes. The default values for JGDPMTPRLEV and JGDPOITPRLEV are 0. In the Alternative World Oil Price Simulations, discussed above, a GDP elasticity with respect to world oil price of 0.02 is assumed for the two foreign real GDPs. This implies that these GDPs change by 0.02 percent for every 1 percent change in the world oil price from the Reference Case. The value of 0.02 for the GDP elasticity with respect to world oil price is based on empirical research findings.

Flowcharts of MAM

The following seven flowcharts show the flow of information from the NEMS to the MAM and how the flows of energy and economic information are passed among the components of the MAM. This set of flowcharts identifies the tasks performed by each of the MAM's models and may not necessarily follow the actual programming sequence. The latter will be discussed in the next section, along with another set of flowcharts presenting the programming steps and subroutines.

Figure 1 summarizes the entire NEMS-MAM integrated system. The remaining six figures focus on the various forecasting models contained in the macroeconomic, industrial output, employment and regional models of the MAM. In each model, a reference economic forecasts using the structural models described in Part A was created and linked to the NEMS to initialize the system.

The MAM is best described as a feedback system that modifies the reference scenario given changes in energy events or policies. This applies to all NEMS runs including the reference and sensitivity cases of the Annual Energy Outlook. To do this, alternative NEMS values of energy prices and quantities are first transformed into concepts compatible to those in the MAM models. The growth rates of these alternative NEMS series are applied to the last historical value to create new energy forecasts. These new series are put into the model as predetermined variables, and a new scenario is run.

The models in the MAM are run sequentially. The macroeconomic model is the first to run with the new energy market assumptions. It is followed by the industrial output and employment models and finally by the regional models. The downstream models in the MAM depend upon the forecast of those models executed before it for predetermined variables. There is no feedback loop within MAM. That is, the forecast of an upstream model is not affected by the results of a downstream model in the same NEMS cycle. When one cycle of the MAM is complete, the forecast is written to the global data structure of the NEMS for use by it other modules.. Subsequent energy market forecasts from the NEMS are returned to the MAM, if model convergence criterions are not satisfied.

6. Operation of MAM within NEMS

The Macroeconomic Activity Module (MAM) is one of a number of FORTRAN source files (also known as modules) that, after compiled and linked, compose the National Energy Modeling System (NEMS) executable. The MAM consists of nine subroutines used to read inputs, compute and apply shocks to the MAM models, simulate those models and write out the resulting forecast. Figure 7 diagrams the flow of control within the MAM.

MAC Subroutine

All of the activities in the MAM are directed by the MAC subroutine, the driver subroutine. In addition to making calls on the remaining eight subroutines in the MAM, the MAC subroutine has two tasks of its own. It writes the MC_ENERGY output[1] spreadsheet of the NEMS energy prices and quantities that are the exogenous assumptions to the models in the MAM. This spreadsheet includes aggregates and components used to compute the assumptions. The values of the NEMS energy prices and quantities contained in the spreadsheet are read from the global data structure. All prices in the spreadsheet are reported in 2000 dollars. The second task done by the MAC subroutine is supplying the remaining modules and the report writer of the NEMS with the MAM results by writing model forecasts to the global data structure. Once this is complete, the MAC subroutine returns program control to the NEMS.

READMAC Subroutine

As mentioned, the MAC subroutine is the driver and calls all the remaining subroutines in the MAM. The first subroutine called is named READMAC. This subroutine is called just once per run in the first iteration of the first year of a NEMS run. The READMAC subroutine opens and reads the contents of one input file. This is an input text file of the MAM parameter settings named MCPARMS (Table B2).

DRTLINK Subroutine

The second subroutine called by the MAC is named DRTLINK. This subroutine is responsible for executing the suite of Global Insight's national and EIA's regional models. Like the READMAC subroutine, the DRTLINK subroutine executes only in the first iteration of the first year of a NEMS run. To execute though, the DRTLINK subroutine has an additional condition to satisfy. There are instances when the modeler does not want the forecast of the other NEMS modules affected by a change from the MAM's reference values. The presence of feedback is controlled with the NEMS parameter MACFDBK. When the feedback switch is set to zero, the

[1] Files that are "output" files reside in the NEMS simulation output directory. The NEMS directory names begin with the character "d" which is followed by a date key and a letter identifying the particular run done that day. Files that are "input" files reside within the input subdirectory of the NEMS output directory.

DRTLINK subroutine is not called. The value of the MACFDBK parameter is set in the NEMS scenario descriptor file (Table B2).

Much of what the DRTLINK subroutine does is preparation for executing the suite of Global Insight's national and EIA's regional models within Quantitative Micro Software's EViews software. The subroutine begins by computing exogenous assumptions using the NEMS energy prices and quantities read from the global data structure (Table B3). It then builds an EViews output program file called DRIVERS. The DRIVERS program file contains instructions written in the EViews programming language. The commands in this program file import exogenous assumptions, temporarily alter model structure, simulate Global Insight's and EIA's models and export forecast results. Program control is temporarily transferred to EViews as it executes the commands in the DRIVERS program file. The resulting model forecasts are written to the following six output spreadsheets:

1. EPMAC.WK1 – level of national level economic activity, industrial output and employment
2. MC_COMMFLR.WK1 – level of commercial floorspace by Census Division (Table B11)
3. MC_REGEMP.WK1 – level of employment by Census Division (Table B12)
4. MC_REGIO.WK1 – level of industrial output by Census Division (Table B13)
5. MC_REGMAC.WK1 – level of economic activity by Census Division (Table B10)
6. MC_VEHICLES.WK1 – national level of light truck sales by sales class (Table B8)

Once EViews completes execution of the DRIVERS program, control is returned to the DRTLINK subroutine. The DRTLINK subroutine reads the forecasts contained in each of the above spreadsheets. The forecasted values stored in the above output spreadsheet are in levels. Control is then returned to the MAC subroutine. The MAC subroutine then calls its third subroutine, INDUSTSUB.

INDUSTSUB Subroutine

The INDUSTSUB subroutine operates in a manner similar to that described for the MAC subroutine. Forecasted levels coming from Global Insight's model of industrial output are stored in the EPMAC spreadsheet. The resulting forecast covers thirty-five categories of industrial output and ten categories of services. The forecast is written to the MC_INDUSTRIAL spreadsheet (Table B8).

Five energy industries in the MAM are overwritten by calculated output based on the NEMS activity. These are:

1. Petroleum refining
2. Coal mining
3. Oil and gas extraction
4. Electric utilities and
5. Gas utilities

The MAM computes annual growth rates from the NEMS forecast of energy sector outputs (Table B6). Each of the growth rates is dynamically applied beginning with an initial historical value. The resulting time series becomes the industrial output forecast for the five energy industries.

REGIONSUB Subroutine

The REGIONSUB subroutine is the fourth subroutine called by the MAC subroutine. Because of the introduction to the MAM of EIA's regional models, the role of this subroutine has been greatly reduced. In past Annual Energy Outlooks (AEO), the REGIONSUB subroutine would share the national forecast out to the nine Census Divisions. Now, the REGIONSUB subroutine copies and aggregates EIA's regional model forecasts for export to the global data structure and for writes to the MC_REGIONAL spreadsheet (Table 11).

EMPLOYMENT Subroutine

The fifth subroutine called by the MAC subroutine is named EMPLOYMENT. This subroutine works just like the INDUSTSUB subroutine. Forecasted levels coming from Global Insight's model of employment by industry are written to the EPMAC output spreadsheet. The resulting forecast is for thirty-five categories of industrial and ten categories of service employment.

The NEMS supplies the forecast of employment for two of the five energy-related industries. These two industries are coal mining and oil and gas extraction. Their forecast is done just as it was for the energy-related industries in the model of industrial output. The NEMS supplies the forecasts, and the MAM computes annual growth rates that are dynamically applied beginning with an initial historical value for the respective variable. Employment forecasts for the three remaining energy industries are computed like those for all the other employment variables. Since the model of industrial output executes before the model of employment, the employment results for the remaining three energy sectors are affected by the NEMS industrial forecast. The five NEMS energy industries are:

1. Petroleum refining
2. Coal mining
3. Oil and gas extraction

4. Electric utilities and
5. Gas utilities

COMFLR Subroutine

The COMFLR subroutine is the sixth subroutine called by the MAC subroutine. This subroutine use to contain a model of commercial floorspace written in FORTRAN. The model has since been moved to EViews. As a result, the role of this subroutine has been greatly reduced. The COMFLR subroutine copies and aggregates the EViews model forecast in preparation for writes to the global data structure and to the MC_REGIONAL spreadsheet (Table B9).

TRANC Subroutine

The TRANC subroutine is the seventh subroutine called by the MAC subroutine. This subroutine copies light truck unit sales forecast in preparation for writes to the global data structure. Equations added to Global Insight's model of the U.S. economy share out total light truck sales by size class. Light trucks are vehicles with gross vehicle weight ratings of 14,000 pounds and less. Light truck sales are divided into the following size classes:

1. Unit Sales of Class 1 Light Trucks, 0 to 6000 lbs.
2. Unit Sales of Class 2 Light Trucks, 6001 to 10,000 lbs.
3. Unit Sales of Class 2a Light Trucks, 6001 to 8,500 lbs.
4. Unit Sales of Class 2b Light Trucks, 8,501 to 10,000 lbs.
5. Unit Sales of Class 3 Light Trucks, 10,001 to 14,000 lbs.

All unit sales of light trucks are measured in thousands of vehicles.

MACOUTPUT Subroutine

Once the TRANC subroutine has finished, program control is returned to the MAC subroutine. The MAC subroutine writes all of the MAM forecasts to the global data structure. That allows the other modules in the NEMS to use the forecasts including the report writer. The MAC subroutine then calls the final MAM subroutine, MACOUTPUT. The MACOUTPUT subroutine writes five output spreadsheets that record the activities of the MAM for a NEMS run. The five output spreadsheets are:

1. MC_COMMON - Contains forecast values of variables written to the global data structure from Global Insight's U.S. and EIA's regional models. These include forecasts of economic activity, industrial output, employment by industry and stocks of commercial floorspace. Table B14 indicates the MAM variables used by other NEMS Modules.

2. MC_NATIONAL - Contains the forecast of macroeconomic variables. The forecast is done using Global Insight's model of the U.S. economy. Table B5 lists the contents of the

MC_NATIONAL spreadsheet.

3. MC_INDUSTRIAL - Contains the forecast of industrial output for thirty-five manufacturing industries at the Census Division level as well as for the U.S. There is a U.S. forecast for the ten services. Table B8 lists the contents of the MC_INDUSTRIAL spreadsheet.

4. MC_EMPLOYMENT - Contains the forecasted employment values of the forty-five manufacturing and service industries. The forecast is done using the Employment Model. Table B7 lists the contents of the MC_EMPLOYMENT spreadsheet.

5. MC_REGIONAL - Contains the forecasted values of the regional variables by Census Division as well as for the U.S. EIA's regional models of economic activity, industrial output and employment by industry do the regional forecast. Table B9 lists the contents of the MC_REGIONAL spreadsheet.

Once the last spreadsheet is written, program control is returned to the MAC subroutine, which in turn returns program control to the NEMS.

Appendix A: VARIABLES AND CLASSIFICATIONS IN MAM MODELS

Macroeconomic Model Detail

Table A1. Real Personal Consumption Variables in the Global Insight Model of the U.S. Economy *

Personal consumption expenditures	**CONSR**
Durables	**CDR**
Motor vehicles & parts	**CDMVR**
Light vehicles	CDMVLVR
Tires, tubes, accessories & parts	CDMVTTPR
Other motor vehicles & parts	CDMVOR
Used automobiles	CDMVPUNAR
Furniture and appliances	**CDFHER**
Computers and software	**CDFHEMAVCR**
Computers	CDFHEMAVCCPR
Software	CDFHEMAVCSWR
Furniture exc. computers & software	CDFHEXCASR
Other durable goods	**CDOR**
Medical devises	CDOOAOR
All other (1)	CDOOR
Nondurables	**CNR**
Food	**CNFR**
On-premise meals & beverages	CNFOUTR
Food for off-premise consumption	CNFHOMER
Food on farms, furnished free	CNFFREER
Clothing & shoes	CNCSR
Gasoline & motor oil	CNEGAOR
Fuel oil & coal	CNEFACR
Other nondurables	C**NOR**
Tobacco products	CNOTOBR
Prescription & over-the-counter drugs	CNODRUGR
All other (2)	CNOOR
Services	**CSVR**
Housing	CSVHSR
Household operation	**CSVHOPR**
Gas	CSVHOPGR
Electricity	CSVHOPER
Telephony	CSVHOPTR
Water & sewer	CSVHOPWASR
Domestic service	CSVHOPDOMR
Other household operation (3)	CSVHOPMSCR

Transportation	**CSVTSR**
Motor vehicle leases	CSVTSURPLLSR
Other user-operated transportation	CSVTSUOXLSER
Purchased local transportation	CSVTSPLR
Purchased intercity transportation	CSVTSPICR
Medical Care	CSVMR
Recreation	CSVRECR
Personal business services	**CSVOPBR**
Financial services furnished free	CSVOPBFREER
Other personal business services	CSVOPXBFREER
Other services (4)	CSVOOR

* Variables denoted in bold are defined by identities.

(1) sports equipment, jewelry, boats, books, etc.
(2) toilet articles, semidurable house furnishings, cleaning stuff, toys, magazines, flowers, net foreign remittances, etc.
(3) insurance, postage, etc.
(4) education, personal care, net foreign travel, etc.

Table A2. Real Business Investment Variables in the Global Insight Model of the U.S. Economy *

Real private fixed nonresidential investment	**IFNRER**
Investment in nonresidential equipment and software	**IFNREER**
Information equipment	**IFNREEIPR**
Computer equipment	IFNREEIPCCR
Software	IFNREEIPCSR
Communications equipment	IFNREEIPCTR
Other information equipment (1)	IFNREEIPOR
Industrial equipment	IFNREEINDR
Transportation equipment	**IFNREETR**
Light vehicles	IFNREETLVR
Aircraft	IFNREETACR
Other transportation equipment (2)	IFNREETOR
Other equipment (3)	IFNREEOR
Investment in nonresidential structures	**IFNRESR**
Structures excluding public utility & mines	**IFNRESBAOR**
Nonfarm buildings	**IFNRESXFR**
Industrial	IFNRESMFGR
Commercial	IFNRESCMLR
Other nonfarm buildings (4)	IFNRESBOTHR
Other buildings (5)	IFNRESOTHR
Mines & wells	IFNRESMIR
Public utilities	**IFNRESPUR**
Public utilities exc. communications	IFNRESPUOR
Communications infrastructure	IFNRESPCR
Inventory investment (change in real stock of inventories)	**IIR**
Nonfarm inventories	**IINFR**
Manufacturing	IIMR
Wholesale trade	IIWR
Retail trade	**IIRTR**
Motor vehicles	IIRT441R
All other	IIRTX441R
Miscellaneous	**IIMISCR**
Construction, mining & utilities	IICMIUR
Other business	IIOR
Farm inventories	IIFR

* Variables denoted in bold are defined by identities.

(1) copiers, instruments, office & accounting equipment
(2) buses, railroad equipment, ships
(3) furniture, farm equipment, electrical equipment, service industry machinery less sale of used stuff other than vehicles
(4) religious, educational, medical
(5) farm, brokers' commissions

Table A3. Real Residential Investment Variables in the Global Insight Model of the U.S. Economy *

Housing starts including mobile homes	**HUS**
Housing starts	**HUSPS**
Single-family starts	HUSPS1
Multi-family starts	HUSPS2A
Mobile home shipments	HUSMFG
Housing sales	
New single-family homes sales	HU1NSOLD
New single-family homes for sale	HU1NFSALE
Sales of existing single-family home	HU1ESOLD
Real private fixed residential investment	**IFRER**
Structures	**IFRESR**
Permanent site structures	**IFRESPER**
Single family houses	IFRESPESFR
Multi-family structures	IFRESPEMFR
Other residential structures	**IPRESOR**

Industry and Employment Model Detail

Table A11. Macroeconomic Expenditure Categories Driving the Industry Model

Personal Consumption Expenditures

CDFHEMAVC	Consumer spending on computers & software
CDFHER	Real consumer spending on furniture and appliances
CDMVLVR	Real consumer spending on light vehicles
CDMVTTPR	Real consumer spending on tires
CDOR	Real consumer spending on other durables plus medical devices
CNCSR	Real consumer spending on clothing & shoes
CNEFACR	Real consumer spending on fuel oil & coal
CNEGAOR	Real consumer spending on gasoline & motor oil
CNFHOMER	Real consumer spending on food for off-premise consumption
CNFOUTR	Real consumer on-premise spending on meals and beverages
CNODRUGR	Real consumer spending on prescription & over-the-counter drugs
CNOTOBR	Real consumer spending on tobacco products
CNOR	Real consumer spending on other nondurable goods
CSVHOPUR	Real consumer spending on household operation, utilities
CSVHOPER	Real consumer spending on electricity
CSVHOPGR	Real consumer spending on natural gas
CSVHOPWASR	Real consumer spending on water & sewer service
CSVHOPTR	Real consumer spending on telephony
CSVHOPXUR	Real consumer spending on household operation, other than utilities
CSVHOPDOMR	Real consumer spending on domestic service
CSVHOPMSCR	Real consumer spending on other household operations
CSVHSR	Real consumer spending on housing
CSVMR	Real consumer spending on medical services
CSVOPBR	Real consumer spending on personal business services
CSVRECR	Real consumer spending on recreation services
CSVTSPICR	Real consumer spending on intercity transportation
CSVTSXPICR	Real consumer spending on transportation other than intercity
CSVTSPLR	Real consumer spending on purchased local transportation
CSVTSUOXLSER	Real consumer spending on other user-operated transportation
CSVTSURPLLSR	Real consumer spending on motor vehicle leases
CSVOOR	Real consumer spending on other services

Investment and Inventories

IFMVNATLR	Real gross investment purchases of light vehicles
IFNREEINDR	Real gross nonresidential investment in industrial equipment
IFNREEIPCC	Gross nonresidential investment in computer equipment
IFNREEIPCSR	Real gross nonresidential investment in software
IFNREEIPCTR	Real gross nonresidential investment in communications equipment
IFNREEIPOR	Real gross nonresidential investment in other information processing equipment

Investment and Inventories continued

IFNREETACR	Real gross nonresidential investment in aircraft
IFNREETOR	Real gross nonresidential investment in other transportation equipment
IFNREEOR	Real gross nonresidential investment in other equipment
IFSR	Real gross investment in all structures
IIR	Real change in stock of business inventories

Government Spending

GFMLGIR	Real federal defense gross investment
GFMLR	Real federal defense purchases of goods & services
GFOGIR	Real federal non-defense gross investment
GFOR	Real federal non-defense purchases of goods & services
GSLGIR	Real state & local gross investment
GSLR	Real state & local purchases of goods & services

Exports

XGAUTOR	Real exports of motor vehicles & parts
XGCR	Real exports of non-automotive consumer goods
XGFFBR	Real exports of foods, feeds & beverages
XGINR	Real exports of industrial materials & supplies
XGKCAEPR	Real exports of aircraft
XGKCPPR	Real exports of computer equipment
XGKOR	Real exports of other capital equipment
XGOR	Real exports of other goods
XSVTOTR	Real exports of services

Imports

MGAUTOR	Real imports of motor vehicles & parts
MGCR	Real imports of non-automotive consumer goods
MGFFBR	Real imports of foods, feeds & beverages
MGINR	Real imports of industrial supplies excl. petroleum
MGKCAEPR	Real imports of aircraft
MGKCPPR	Real imports of computer equipment
MGKOR	Real imports of other capital equipment
MGPETR	Real imports of petroleum & products
MGOR	Real imports of other goods
MSVTOTR	Real imports of services

Table A12. Detailed Sectoral Classification for Industry and Employment Models

In the Global Insight (GI) model, output value series has "R" as prefix, and real value series has "R" as suffix (e.g. R111R); employment series has "E" as prefix (e.g. E111). The MAM variable names for output values are prefixed with REV (e.g. REVIND1) and those for employment are prefixed with EMP (e.g. EMPIND1). They are placed into three NEMS variables - MC_REVIND (output of industrial sectors), MC_REVSER (output of services sectors) and MC_EMPNA (employment).

GI Code	Description	NAICS (1997) codes	NEMS Sector
Nonmanufacturing Industries			
Agriculture, Forestry, Fishing & Hunting			
111	Crop Production	111	IND30
112	Animal Production	112	IND31
113	Forestry & Logging	113	IND31
11O	Agriculture, Other	114, 115	IND31
Mining			
211	Oil & Gas Extraction	211	IND33
2121	Coal Mining	2121	IND32
2122	Metal Ore Mining	2122	IND34
2123	Nonmetallic Mineral Mining	2123	IND34
213	Support Activities For Mining	213	IND33
Construction			
23	Construction	23	IND35
Manufacturing Industries			
311	Food Products	311	IND1
312	Beverage and Tobacco Products	312	IND2
313	Textile Mills	313	IND3
314	Textile Products	314	IND3
315	Apparel	315	IND4
316	Leather and Allied Products	316	IND17
321	Wood Products	321	IND5
3221	Pulp, Paper, and Paperboard Mills	3221	IND7
32221	Paperboard Container Manufacturing	32221	IND7
322O	Other Paper Manufacturing	32222 - 32229	IND7
323	Printing	323	IND8
32411	Petroleum Refineries	32411	IND14
324O	Other Petroleum and Coal Products Manufacturing	32412, 32419	IND15
32511A9	Basic Organic Chemicals	32511, 32519	IND10

GI Code	Description	NAICS (1997) codes	NEMS Sector
Manufacturing Industries continued			
32512T8	Basic Inorganic Chemicals	32512 - 32518	IND9
3252	Resins, Synthetic Rubber and Synthetic Fibers	3252	IND11
3253	Pesticide, Fertilizer and Other Agricultural Chemicals	3253	IND12
3254T9	Other Chemical Products	3254 - 3259	IND13
326	Plastics and Rubber Products	326	IND16
3272	Glass and Glass Products	3272	IND18
32731	Cement	32731	IND19
327O	Other Nonmetallic Mineral Products	3271, 32732 - 32739, 3274, 3279	IND20
3311A2	Iron and Steel Mills and Ferroalloy and Steel Products	3311, 3312	IND21
3313	Alumina and Aluminum Products	3313	IND22
3314A5X1	Other Primary Metals	3314, 33152	IND23
33151	Ferrous Metal Foundries	33151	IND23
332	Fabricated Metal Products	332	IND24
333	Machinery	333	IND25
3341	Computer and Peripheral Equipment	3341	IND26
334413	Semiconductor and Related Devices	334413	IND26
334511	Search and Navigation Instrument Manufacturing	334511	IND26
3345X11	Electromedical, Measuring, and Control Instruments	3345 less 334511	IND26
334A5O	Other Electronic and Electrical Equipment, Appliance and Components	3342 - 3344, 3346	IND26
335	Electric Equipment and Appliances	335	IND28
336	Transportation Equipment	336	IND27
337	Furniture and Related Products	337	IND6
339	Miscellaneous Durable Products	339	IND29
Services			
Utilities			
2211	Power Generation & Supply	2211	SER3
2212	Natural Gas Distribution	2212	SER4
2213	Water, Sewage & Related Systems	2213	SER5
Wholesale and Retail Trade			
42	Sales: Wholesale Trade, (Includes Cost of Goods Sold)	42	SER6
44A5	Total Retail Trade, (Includes Cost of Goods Sold)	44, 45	SER7
Transportation			
48A9	Transportation and Warehousing	48, 49	SER1

GI Code	Description	NAICS (1997) codes	NEMS Sector
Other services			
5111	Newspaper, book, and directory publishers	5111	SER9
5133	Telecommunications	5133	SER2
513X33	Radio and Television Broadcasting & Cable Networks	513 less 5133	SER2
52	Finance and Insurance	52	SER8
53	Real Estate and Rental And Leasing	53	SER8
SERV	Other private services	5112, 512, 514, 54 - 81	SER9
921	Federal Government	921	SER10
922A3	State & Local Government	922, 923	SER10

Notes:

1. Employment code E11O covers both animal production and "other" (NAICS 112, 114 and 115).
2. The Employment Model adopts the forecasts series for federal government employees (EG91) and for state and local government employees (EGSL) from the U.S. Macroeconomic Model. The corresponding NEMS code is SER10 and SER11.

Regional Model Detail

Table A13. Economic Variables in the Regional Model

Name	Description
CPI	Consumer Price Index, All Urban, 1982-84 = 1.0
GSPR	Real Gross State Product, billions of chained 2000 dollars
RWM	Average Annual Manufacturing Wages, thousands of nominal $
RWNM	Average Annual Non-Manufacturing Wages, thousands of nominal $
YP	Personal Income, billions of nominal dollars
YPCOMPWSD	Wage & Salary Disbursements, billions of nominal dollars
YPCOMPWSDG	Wage & Salary Disbursements, Government, billions of nominal $
YPCOMPWSDP	Wage & Salary Disbursements, Private, billions of nominal dollars
YPD	Personal Disposable Income, billions of dollars
YPDR	Real Disposable Personal Income, billions of chained 2000 dollars
YPDRZNP	Real per Capita Personal Disposable Income, billions of 2000 dollars
YPOTH	Other Personal Income, billions of dollars
NP	Total Population, Including Armed Forces Overseas, millions
HUSPS1	Single-Family Housing Starts, millions of units
HUSPS2A	Multi-Family Housing Starts, millions of units
HUSMFG	Shipments of Mobile Homes, millions of units
KHUPS1	Stock of Single-Family Housing, millions of units
KHUPS2A	Stock of Multi-Family Housing, millions of units
KHUMFG	Stock of Mobile Homes, millions of units

Table A14. Output and Employment Detail in the Regional Model

NEMS Sector	Description	NAICS (1997) codes
Manufacturing Industries:

SER8	Finance & Insurance, Real Estate	52, 53
SER9	Other Services	51, 54 - 81
SER10	Public Administration	921, 922, 923
	Federal (Employment only)	921
	State and Local (Employment only)	922, 923

Table A15. Commercial Floorspace Types

Code	Description
STORES	Stores and restaurants
WARE	Manufacturing and wholesale trade, public and federally-owned warehouses
OFFICE	Private, federal, and state and local offices
AUTO	Auto service and parking garages
MFG	Manufacturing
EDUC	Primary, secondary and higher education
HEALTH	Health - hospitals and nursing homes
PUB	Federal and state and local government
REL	Religious
AMUSE	Amusement
MISCNR	Miscellaneous, non-residential - transportation related and all other not elsewhere classified
HOTEL	Hotels and motels
DORM	Dormitories, educational and federally-owned (primarily military)

Appendix B: MAM Inputs and Outputs

Introduction

Appendix B describes the inputs, parameters and files required for execution of the Direct Link, Industrial Output, Employment, Regional, Commercial Floorspace and Transportation sub-modules of the Macroeconomic Activity Module (MAM). This appendix also presents the primary outputs generated by MAM for the benefit of NEMS and of the MAM output files. As described in the main text of this volume, the Direct Link sub-module of MAM uses Global Insight's U.S. Macroeconomic Activity, Industrial Output and Employment models. The EIA staff and contract support developed the remaining models of the MAM. These include models of regional economic activity, industrial output and employment, changes to the regional stocks of commercial floorspace and unit sales of light trucks. Unlike Global Insight's models, the EIA models are not proprietary. Table B1 identifies the files that are used and are created by the MAM during the execution of the NEMS. It also indicates whether each file is an input or output file and describes its contents.

Inputs

Table B2 describes the MAM parameters and controls specified at the start of a NEMS run. They include user-specified modeling switches and array dimensions used in MAM's FORTRAN source code. The user-specified switches enable the modeler to choose among alternative assumptions for the scenario.

Inputs from NEMS

Before the MAM executes Global Insight's U.S. model in EViews, twenty-six energy prices and quantities are computed using inputs from the NEMS. These are energy assumptions exogenous to Global Insight's models. Table B3 lists and defines these energy assumptions. For each, the Global Insight model mnemonic is given along with its definition. The final column of Table B3 lists the NEMS variables used to calculate the corresponding Global Insight variable.

The MAM also calculates industrial gross output growth rates for the energy sectors (Petroleum Refining, Coal Mining, Oil & Gas Extraction, Electric Utilities, and Gas Utilities) based upon physical activity for the appropriate NEMS supply or conversion modules, and then applies them to the historical output series in the Industrial Output model. In the Employment model, employment forecast for two energy sectors (Coal Mining and Oil & Gas Extraction) are computed using growth rates extracted from the appropriate NEMS modules. Table B4 describes the NEMS variables used to calculate the growth rates for each sector.

Outputs

Table B5 lists the U.S. macroeconomic variable outputs returned to the MAM from EViews. Annual data beginning in 1990 and forecast through 2030 are recorded in the spreadsheet named MC_NATIONAL.

Table B6 defines industrial gross output variables contained within the Industrial Output sub-module of the MAM. Forecast growth rates of the five energy industry sectors are replaced by the NEMS results. MC_INDUSTRIAL is a spreadsheet that presents the history and forecasts of industrial output by sector for the nine Census Divisions and for the United States.

Table B7 defines the employment variables contained in the Employment Submodule of the MAM. Forecast growth rates of two energy industrial sectors are replaced by the NEMS results. Historical and forecast data for the detailed industrial sectors and aggregates are shown in the MC_EMPLOYMENT spreadsheet.

Table B8 defines the light truck variables contained in the TRANC Submodule of the MAM. Annual data beginning in 1990 and forecast through 2030 are recorded in the spreadsheet named MC_VEHICLES.

Regional data and commercial floorspace data produced by the Regional Submodule and the Commercial Floorspace Submodule of the MAM are presented in the MC_REGIONAL spreadsheet. Table B9 describes the regions and variables contained in that spreadsheet. The same regional forecasts for economic activity, commercial floorspace, employment and industrial output contained in the MC_REGIONAL spreadsheet are also found in the MC_REGMAC, MC_COMMFLR, MC_REGEMP and MC_REGIO spreadsheets respectively. Table B10 describes the regions and variables contained in the output spreadsheet MC_REGMAC for EIA's regional economic activity model. Table B11 describes the regions and variables contained in the output spreadsheet MC_COMMFLR for EIA's regional commercial floorspace model. Table B12 describes the regions and variables contained in the output spreadsheet MC_REGEMP for EIA's regional employment model. Table B13 describes the regions and variables contained in the output spreadsheet MC_REGIO for EIA's regional industrial output model.

Table B14 lists the MACOUT common block variables referenced by other NEMS modules. The final column lists the referencing NEMS modules and submodules. A description of the module and submodule abbreviations follows Table B14.

Table B1. MAM Input and Output Files

Filename	Content	Input or Output
ALTDATA.WK1	NEMS energy price and quantity data used as MAM drivers	Input
COMFLOOR.XLS	Data for EIA's commercial floorspace, regional, industrial output and employment models	Input
DRIVERS.PRG	Run-specific EViews program file	Input
DRVDATA.WF1	EViews workfile of annual frequency	Input
EPMAC.WK1	Forecast of macroeconomic, industrial output and employment models in levels	Input
EVIEWSDB.EDB	Intermediary database for workfiles of annual and quarterly frequency	Input
MC_COMMFLR.WK1	Regional commercial floorspace model solution	Output
MC_COMMON.WK1	MAM forecasts written to Global Data Structure.	Output
MC_DETAIL.WK1	Detailed US macroeconomic model solution	Output
MC_EMPLOYMENT.WK1	US employment model solution and base	Output
MC_ENERGY.WK1	NEMS energy variables read from Global Data Structure	Output
MC_INDUSTRIAL.WK1	US industrial model solution and base	Output
MC_NATIONAL.WK1	US macroeconomic model solution, base and percent change from base	Output
MC_REGEMP.WK1	Regional employment model solution	Output
MC_REGIO.WK1	Regional industrial output model solution	Output
MC_REGIONAL.WK1	Regional model solution and base	Output
MC_REGMAC.WK1	Regional economic model solution and base	Output
MC_VEHICLES.WK1	Light truck unit sales model solution	Output
MCCOMFLR.WF1	Regional commercial floorspace model	Output
MCEVCODE.TXT	Generic EViews program file used to create run-specific drivers program file	Input
MCEVEPMD.WF1	US employment model	Output
MCEVIOMD.WF1	US industrial output model	Output
MCEVSUBS.PRG	EViews subroutines	Input
MCEVWORK.WF1	US macroeconomic model	Output
MCHIGHLO.XLS	High and low economic activity model factors and transportation model size class data	Input
MCPARMS.TXT	Parameters	Input
MCREGIND.WF1	Regional industrial output and employment models	Output
MCREGIONAL.WF1	Regional economic model	Output

File Extension Key:

File Extension	File Type
EDB	EViews database
PRG	EViews program file
TXT	Text file
WF1	EViews workfile
WK1	Lotus 1-2-3 file
XLS	Microsoft Excel file

Table B2. MAM Input Controls and Parameters

Parameter Name	Input Type (filename)	Input Description
CAFE	User-defined parameter (SCEDES)	Unit cost of automobiles under new CAFE standards, 0=No change from baseline, 1=factor cost determined by NEMS TRAN results
EVVERS	Run-time option (SCEDES)	Version of EViews used in simulation; 6 = v.6, 5 = v.5
EXM	Run-time option (SCEDES)	MAM Module Switch, 1 = on, 0 = off
MACFDBK	Run-time option (SCEDES)	Macroeconomic feedback lever, 1 = on, 0 = off
MACTAX	User-defined parameter (SCEDES)	Distribution of energy tax, 0=No distribution, other parameter values defined according to requirements of study
MAMLASTYR=41	MAM parameter (MCPARMS)	MAM/EViews last year, 2030-1990+1
MMAC	Run-time option (SCEDES)	Macroeconomic growth scenario: 1 = Low, 2 = Reference, 3 = High
MCNMFDVARS=59	MAM parameter (MCPARMS)	Number of macroeconomic final demand variables
MCNMFLTYPE=14	MAM parameter (MCPARMS)	Number of commercial floorspace types, including total
MCNMIND=35	MAM parameter (MCPARMS)	Number of regionalized industry output variables
MCNMINV=216	MAM parameter (MCPARMS)	Number of capital equipment variables
MCNMMAC=74	MAM parameter (MCPARMS)	Number of non-regionalized macroeconomic variables
MCNMMACREG=57	MAM parameter (MCPARMS)	Number of regionalized macroeconomic variables
MCNMNATREG=14	MAM parameter (MCPARMS)	Number of regionalized macroeconomic variables
MCNMSERV=10	MAM parameter (MCPARMS)	Number of non-regionalized service output variables
MCNUMMNF=29	MAM parameter (MCPARMS)	Number of manufacturing industry variables
MCNUMREGS=11	MAM parameter (MCPARMS)	The nine Census Divisions, a placeholder for California (currently not in use), and the national total of all Census Divisions
NEMSENERGYNUM=211	MAM parameter (MCPARMS)	Number of exogenous variables (aggregates and components) from NEMS

Parameter Name	Input Type (filename)	Input Description
NUMEMPL=46	MAM parameter (MCPARMS)	Number of Industrial Employment categories
NUMEPMAC=179	MAM parameter (MCPARMS)	Number of solution variables returned to MAM from EViews
RMFFLEV=0.90	MAM parameter (MCPARMS)	Federal Fund Rate Lever, 0=Rate determined by balance of reserve, 1=Rate determined in response to changes in inflation and unemployment
SCENNUM=131	MAM parameter (MCPARMS)	Number of driver variables passed to EViews models from MAM
TTECH	User-defined parameter (SCEDES)	Technology scenario: 1 = Low, 2 = Reference, 3 = High

Table B3. NEMS Input Variables for MAM National Submodule

MAM Variable Name	Definition	NEMS Variable Name and Source
CNEFACR	Consumption of Household Fuel Oil	QBLK Common Block: QTPRS – Total Petroleum, Residential
CNEGAOR	Consumption of Consumer Gasoline and Oil	QBLK Common Block: QMGTR – Motor Gasoline, Transportation QDSTR – Distillate, Transportation QETTR – Ethanol, Transportation
CSVHOPER	Consumption of Household Electricity	QBLK Common Block: QELRS – Electricity, Residential
CSVHOPGR	Consumption of Household Natural Gas	QBLK Common Block: QNGRS – Natural Gas, Residential
DALLFUELS	Demand for All Fuels – All Sectors	QBLK Common Block: QTPAS – Total Petroleum, All Sectors QNGAS – Natural Gas, All Sectors QGPTR – Natural Gas, Pipeline, Transportation QLPIN – Lease and Plant Fuel, Industrial QCLAS – Coal, All Sectors QMCIN – Metallurgical Coal, Industrial QCIIN – Net Coal Coke Imports, Industrial QUREL – Uranium, Electricity QTRAS – Total Renewables, All Sectors QSTRS – Solar Thermal, Residential QGERS – Geothermal, Residential QSTCM – Solar Thermal, Commercial QPVCM – Photovoltaic, Commercial QEIEL – Net Electricity Imports QMETR – Methanol, Transportation QHYTR – Liquid Hydrogen, Transportation
DENDUCOAL	End-Use Demand for Coal	QBLK Common Block: QMCIN – Metallurgical Coal, Industrial QCLAS – Coal, All Sectors QCLEL – Coal, Electricity Generation QCIIN – Net Coal Coke Imports, Industrial

MAM Variable Name	Definition	NEMS Variable Name and Source
DENDUELC	Electricity Sales to Ultimate Consumers	QBLK Common Block: QELAS – Purchased Electricity, All Sectors
DENDUNG	End-Use Demand for Natural Gas	QBLK Common Block: QNGAS – Natural Gas, All Sectors QGPTR – Natural Gas, Pipeline, Transportation QLPIN – Lease and Plant Fuel, Industrial QNGEL – Natural Gas, Electricity
DENDUPET	End-Use Demand for Petroleum	QBLK Common Block: QDSAS – Distillate, All Sectors QDSEL – Distillate, Electricity QKSAS – Kerosene, All Sectors QJFTR – Jet Fuel, Transportation QLGAS – Liquefied Petroleum Gases, All Sectors QMGAS – Motor Gasoline, All Sectors QPFIN – Petrochemical Feedstocks, Industrial QRSAS – Residual Fuel, All Sectors QRSEL – Residual Fuel, Electricity QOTAS – Other Petroleum, All Sectors QSGIN – Still Gas, Industrial QPCIN – Petroleum Coke, Industrial QASIN – Asphalt and Road Oil, Industrial

MAM Variable Name	Definition	NEMS Variable Name and Source
ENGDOMO	Domestic Production of Other Energy	QBLK Common Block: QUREL – Uranium, Electricity QTRAS – Total Renewables, All Sectors QSTRS – Solar Thermal, Residential QSTCM – Solar Thermal, Commercial QETTR – Ethanol, Transportation QPVCM – Photovoltaic, Commercial QHYTR – Liquid Hydrogen, Transportation QGERS – Geothermal, Residential COALOUT Common Block: CQSBB – Production of Coal PMMRPT Common Block: RFETHE85 – Production of E85 RFMETM85 – Production of M85 RFQDINPOT – Other Domestic Inputs to Refiners PMMOUT Common Block: RFCRDOTH - Other Crude Inputs NGTDMREP Common Block: OGPRSUP – Production of Supplemental Natural Gas CONVFACT Common Block: CFINPOT – Other inputs CFNGC – Nat. Gas consumption and production
ENGDOMPETANG	Domestic Production of Petroleum and Natural Gas	PMMBLK Common Block: RFQTDCRD – Production of Crude Oil RFPQNGL – Production of Natural Gas Liquids NGTDMREP Common Block: OGPRDNG – Production of Dry Natural Gas
IPSG211A3	Industrial Production Index, Oil and Gas Extraction	PMMBLK Common Block: RFQTDCRD – Production of Crude Oil RFPQNGL – Production of Natural Gas Liquids CONVFACT Common Block: CFNGC – Nat. Gas consumption and production NGTDMREP Common Block: OGPRDNG – Production of Dry Natural Gas

MAM Variable Name	Definition	NEMS Variable Name and Source
IPSN2121	Industrial Production Index, Coal Mining	COALOUT Common Block: Coal Production (East, West Miss)
JPCNEFAC	Personal Consumption Deflator, Household Fuel Oil	MPBLK Common Block: PTPRS – Residential Total Petroleum Price
JPCNEGAO	Personal Consumption Deflator, Consumer Gasoline and Oil	AMPBLK Common Block: PMGTR – Transportation Motor Gasoline Price PDSTR – Transportation Distillate Price PETTR – Transportation, Ethanol Price QBLK Common Block: QMGTR – Motor Gasoline, Transportation QDSTR – Distillate, Transportation QETTR – Ethanol, Transportation
JPCSVHOPE	Personal Consumption Deflator, Household Electricity	AMPBLK Common Block: PELRS – Residential Purchased Electricity Price
JPCSVHOPG	Personal Consumption Deflator, Household Natural Gas	AMPBLK Common Block: PNGRS – Residential Natural Gas Price
MACEP32_COALMINE	NEMS Employment 32: Coal Mining (NAICS 2121), manufacturing	COALOUT Common Block: TOTMINERS – Number of Coal Miners
MACEP33_OILGASXTRACT	NEMS Employment 33: Oil & Gas Extraction (NAICS 211, 213)	OGSMOUT Common Block: OGJOBS – Number of Jobs in Oil and Gas Supply Sector
MACIO14_PETROREFINE	NEMS Industrial Output 14: Petroleum Refining (NAICS 32411)	PMMRPT Common Block: RFPQIPRDT – Total Imported Petroleum Products PMMOUT Common Block: RFQPRDT – Total Petroleum Product Supplied
MACIO32_COALMINE	NEMS Industrial Output 32: Coal Mining (NAICS 2121), manufacturing	COALOUT Common Block: CQSBB – Total Coal Production

MAM Variable Name	Definition	NEMS Variable Name and Source
MACIO33_OILGASXTRACT	NEMS Industrial Output 33: Oil & Gas Extraction (NAICS 211, 213)	CONVFACT Common Block: CFNGL – Conversion Factor, Natural Gas Liquids NGTDMREP Common Block: OGPRDNG – Production of Dry Natural Gas OGPRSUP – Supplemental Natural Gas Production PMMOUT Common Block: RFPQNGL – Production of Natural Gas Liquids RFQTDCRD – Production of Crude Oil
MACIO38_ELECUTIL	NEMS Industrial Output 38: Electric Utilities (NAICS 2211), services	UEFDOUT Common Block: UGNTLNR(1) – Total Electricity Generation UGNTLNR(2) – Total Electricity Generation
MACIO39_GASUTIL	NEMS Industrial Output 39: Gas Utilities (NAICS 2212), services	NGTDMREP Common Block: OGPRDNG – Total Dry Natural Gas Production
MSVXTOUR	Real imports of services	GHGREP Common Block: GHG_REV(4) – Greenhouse Gas Revenues
PLVAVG	Average price, light-duty vehicles	TRANREP Common Block: AVG_PRC_VEH – Average Price of Vehicles
PNGHH	Henry Hub Cash Market Price of Natural Gas	NGTDMREP Common Block: OGHHPRNG – Price of Natural Gas at Henry Hub
PNGWL	Average Wellhead Price of Natural Gas	NGTDMREP Common Block: OGWPRNG – Natural Gas Wellhead Price
POILIMP	Weighted Average Price of Imported Crude	INTOUT Common Block: IT_WOP – World Oil Price
POILWTI	Price of West Texas Intermediate Crude	PMMRPT Common Block: RFTPQCLL – Price of West Texas Intermediate Crude
QGASASF	Highway Consumption of Gasoline and Special Fuels	QBLK Common Block: QMGTR – Motor Gasoline, Transportation QDSTR – Distillate, Transportation QETTR – Ethanol, Transportation

MAM Variable Name	Definition	NEMS Variable Name and Source
WPI051	Producer Price Index – Coal	AMPBLK Common Block: PCLIN – Industrial Purchased Coal Price
WPI053	Producer Price Index – Gas Fuels	AMPBLK Common Block: PNGIN – Industrial Purchased Natural Gas Price
WPI054	Producer Price Index – Electric Power	AMPBLK Common Block: PELRS – Residential Purchased Electricity Price PELCM – Commercial Purchased Electricity Price PELIN – Industrial Purchased Electricity Price PELTR – Transportation Purchased Electricity Price QBLK Common Block: QELRS – Residential Purchased Electricity QELCM – Commercial Purchased Electricity QELIN – Industrial Purchased Electricity QELTR – Transportation Purchased Electricity
WPI055	Producer Price Index – Utility Natural Gas	AMPBLK Common Block: PNGRS – Residential Natural Gas Price PNGCM – Commercial Natural Gas Price PNGIN – Industrial Natural Gas Price PNGTR – Transportation Natural Gas Price PNGEL – Natural Gas Price to Electric Generators QBLK Common Block: QNGRS – Residential Purchased Natural Gas QNGCM – Commercial Purchased Natural Gas QNGIN – Industrial Purchased Natural Gas QNGTR – Transportation Purchased Natural Gas QNGEL – Electricity, Natural Gas
WPI0561	Producer Price Index – Crude Petroleum	INTOUT Common Block: IT_WOP – World Oil Price

MAM Variable Name	Definition	NEMS Variable Name and Source
WPI057	Producer Price Index – Refined Petroleum Products	AMPBLK Common Block: PTPRS – Residential Total Petroleum Price PDSCM – Commercial Distillate Price PRSCM – Commercial Residual Fuel Price PDSIN – Industrial Distillate Price PRSIN – Industrial Residual Fuel Price PDSTR – Transportation Distillate Price PJFTR – Transportation Jet Fuel Price PMGTR – Transportation Motor Gasoline Price PRSTR – Transportation Residual Fuel Price QBLK Common Block: QTPRS – Residential Total Petroleum QDSCM – Commercial Distillate QRSCM – Commercial Residual Fuel QDSIN – Industrial Distillate QRSIN – Industrial Residual Fuel QDSTR – Transportation Distillate QJFTR – Transportation Jet Fuel QMGTR – Transportation Motor Gasoline QRSTR – Transportation Residual Fuel
WPI0574	Producer Price Index – Residual Petroleum Fuels	AMPBLK Common Block: PRSCM – Commercial Residual Fuel Price PRSIN – Industrial Residual Fuel Price PRSTR – Transportation Residual Fuel Price QBLK Common Block: QRSCM – Commercial Residual Fuel QRSIN – Industrial Residual Fuel QRSTR – Transportation Residual Fuel

Table B4. Energy Industry and Employment Growth Determined by NEMS Results

MACOUT Common Block Name	Industry Sector Definition	NEMS Variable Name and Source
MC_EMPNA(34)	Employment, Coal Mining	COALOUT Common Block: TOTMINERS – Number of coal miners
MC_EMPNA(35)	Employment, Oil and Gas Extraction	OGSMOUT Common Block: OGJOBS – Number of jobs in oil and gas supply sector
MC_REVIND(14)	Output, Petroleum Refining	PMMOUT Common Block: RFQPRDT – Total Petroleum Product Supplied PMMRPT Common Block: RFPQIPRDT – Total Imported Petroleum Products
MC_REVIND(32)	Output, Coal Mining	COALOUT Common Block: CQSBB – Total Coal Production
MC_REVIND(33)	Output, Oil and Gas Extraction	PMMOUT Common Block: RFQTDCRD – Total Crude Oil Production RFPQNGL – Total Natural Gas Plant Liquids Production OGPRDNG – Total Dry Natural Gas Production OGPRSUP – Supplemental Natural Gas Production
MC_REVSER(3)	Output, Electric Utilities	UEFDOUT Common Block: UGNTLNR – Total Electricity Generation
MC_REVSER(4)	Output, Gas Utilities	PMMOUT Common Block: OGPRDNG – Total Dry Natural Gas Production

Table B5. MC_NATIONAL Output Variables

MACOUT Common Block Name	Description
MC_GDPR	Gross Domestic Product, billions of chained 2000$
MC_GDPFER	Gross Domestic Product at full employment, billions of chained 2000$
MC_CONSR	Consumer Spending on all Goods & Services, billions of chained 2000$
MC_IRC	Gross Private Domestic Investment, billions of chained 2000$
MC_XR	Exports of Goods & Services, billions of chained 2000$
MC_MR	Imports of Goods & Services, billions of chained 2000$
MC_GR	Government Purchases of Goods & Services, billions of chained 2000$
MC_CDR	Consumer Spending on Durable Goods, billions of chained 2000$
MC_CNR	Consumer Spending on Nondurable Goods, billions of chained 2000$
MC_CSVR	Consumer Spending on Services, billions of chained 2000$
MC_IFNRESR	Gross Nonresidential Investment in Structures, billions of chained 2000$
MC_IFRESR	Gross Residential Investment, billions of chained 2000$
MC_IFNREER	Gross Nonresidential Investment in Equipment, billions of chained 2000$
MC_IFREER	Gross Residential Investment in Equipment, billions of chained 2000$
MC_IFXR	Gross Private Fixed Investment, billions of chained 2000$
MC_IFNRER	Gross Private Fixed Nonresidential Investment, billions of chained 2000$
MC_IFRER	Gross Private Fixed Residential Investment, billions of chained 2000$
MC_XGFFBR	Exports, Foods, Feeds, & Beverages, billions of chained 2000$
MC_XGINR	Exports, Industrial Supplies & Materials, billions of chained 2000$
MC_XGKR	Exports, Capital Goods exc autos, billions of chained 2000$
MC_XGAUTOR	Exports, Automotive Vehicles, Engines & Parts, billions of chained 2000$
MC_XGCR	Exports, Consumer Goods except Automotive, billions of chained 2000$
MC_XGR	Exports, Goods, billions of chained 2000$
MC_XSVTOTR	Exports, Services, billions of chained 2000$
MC_MGFFBR	Imports, Foods, Feeds, and Beverages, billions of chained 2000$
MC_MGINAPETR	Imports, Industrial Supplies & Materials, billions of chained 2000$
MC_MGKR	Imports, Capital Goods excl. Motor Vehicles, billions of chained 2000$
MC_MGAUTOR	Imports, Motor Vehicles & Parts, billions of chained 2000$
MC_MGCR	Imports, Non-automotive Consumer Goods, billions of chained 2000$
MC_MSVTOTR	Imports, Services, billions of chained 2000$
MC_IIR	Change in Real Stock of Business Inventories, billions of chained 2000$
MC_GFMLR	Federal Defense Purchases of Goods and Services, billions of chained 2000$

MACOUT Common Block Name	Description
MC_GDP	Gross Domestic Product, billions of nominal $
MC_CONS	Consumer Spending on all Goods & Services, billions of nominal $
MC_I	Gross Private Domestic Investment, billions of nominal $
MC_GNPR	Gross National Product, billions of chained 2000$
MC_JPGDP	Chain-Type Price Index, GDP, 2000 = 1.0 (1987 = 1.0 in MC_COMMON)
MC_RMTB3M	Discount Rate on 3-Month U.S. Treasury Bills
MC_RMMTG30CON	Conventional 30-Year Mortgage Commitment Rate
MC_RMCORPPUAA	Yield on AA Utility Bonds
MC_RMGBLUSREAL	Real Average Yield on U.S. Treasury Long-term Bonds
MC_JECIWSP	Employment Cost Index, Wages & Salaries, Private Sector, June 1989 = 1.0
MC_SUVA	Unit Sales of Automobiles, Total, millions of units
MC_SUVLV	Unit Sales of Light Duty Vehicles, Domestic, millions of units
MC_SUVTL	Unit Sales of New Light Trucks, millions of units
MC_SUVTHAM	Unit Sales of Heavy and Medium Trucks, millions of units
MC_RUC	Unemployment Rate, All Civilian Workers
MC_WPI	Producer Price Index, All Commodities, 1982 = 1.0
MC_WPI11	Producer Price Index, Machinery & Equipment, 1982 = 1.0
MC_WPI14	Producer Price Index, Transportation Equipment, 1982 = 1.0
MC_NLFC	Civilian Labor Force as Measured by the Household Survey, millions of persons
MC_RMFF	Effective Rate on Federal Funds
MC_WPI05	Producer Price Index, Fuels, Related Products & Power, 1982 = 1.0
MC_RMTCM10Y	Yield on 10-year Treasury Notes
MC_RMCORPBAA	Yield on Baa-Rated Corporate Bonds
MC_CPIE	Consumer Price Index for Energy
MC_NP65A	Population Aged 65 and Over
MC_JQPCMHNF	Index of Output per Hour in Nonfarm Business
MC_WPISOP3200	Producer Price Index – Finished Producer Goods
MC_WPI10	Producer Price Index – Metals and Metal Products
MC_RLRMCORPPUAA	Real Yield on Baa-Rated Corporate Bonds

Table B6. MC_INDUSTRIAL Output Variables (Variables by Region)

Regions:

Census Division	Description
NENG	New England
MATL	Middle Atlantic
ENC	East North Central
WNC	West North Central
SATL	South Atlantic
ESC	East South Central
WSC	West South Central
MTN	Mountain
PAC	Pacific
US	United States

Variables:

MACOUT Common Block Name	Description
MC_REVIND(1)	Production, Food Products (Billions of Fixed 2000 Dollars)
MC_REVIND(2)	Production, Beverage and Tobacco Products (Billions of Fixed 2000 Dollars)
MC_REVIND(3)	Production, Textile Mills & Textile Products (Billions of Fixed 2000 Dollars)
MC_REVIND(4)	Production, Apparel (Billions of Fixed 2000 Dollars)
MC_REVIND(5)	Production, Wood Products (Billions of Fixed 2000 Dollars)
MC_REVIND(6)	Production, Furniture and Related Products (Billions of Fixed 2000 Dollars)
MC_REVIND(7)	Production, Paper Products (Billions of Fixed 2000 Dollars)
MC_REVIND(8)	Production, Printing (Billions of Fixed 2000 Dollars)
MC_REVIND(9)	Production, Basic Inorganic Chemicals (Billions of Fixed 2000 Dollars)
MC_REVIND(10)	Production, Basic Organic Chemicals (Billions of Fixed 2000 Dollars)
MC_REVIND(11)	Production, Plastic and Synthetic Rubber Materials (Billions of Fixed 2000 Dollars)
MC_REVIND(12)	Production, Agricultural Chemicals (Billions of Fixed 2000 Dollars)
MC_REVIND(13)	Production, Other Chemical Products (Billions of Fixed 2000 Dollars)
MC_REVIND(14)	Production, Petroleum Refineries (Billions of Fixed 2000 Dollars)
MC_REVIND(15)	Production, Other Petroleum and Coal Products (Billions of Fixed 2000 Dollars)

MACOUT Common Block Name	Description
MC_REVIND(16)	Production, Plastics and Rubber Products (Billions of Fixed 2000 Dollars)
MC_REVIND(17)	Production, Leather and Allied Products (Billions of Fixed 2000 Dollars)
MC_REVIND(18)	Production, Glass & Glass Products (Billions of Fixed 2000 Dollars)
MC_REVIND(19)	Production, Cement Manufacturing (Billions of Fixed 2000 Dollars)
MC_REVIND(20)	Production, Other Nonmetallic Mineral Products (Billions of Fixed 2000 Dollars)
MC_REVIND(21)	Production, Iron & Steel Mills, Ferroalloy & Steel Products (Billions of Fixed 2000 Dollars)
MC_REVIND(22)	Production, Alumina & Aluminum Products (Billions of Fixed 2000 Dollars)
MC_REVIND(23)	Production, Other Primary Metals (Billions of Fixed 2000 Dollars)
MC_REVIND(24)	Production, Fabricated Metal Products (Billions of Fixed 2000 Dollars)
MC_REVIND(25)	Production, Machinery (Billions of Fixed 2000 Dollars)
MC_REVIND(26)	Production, Other Electronic & Electric Products (Billions of Fixed 2000 Dollars)
MC_REVIND(27)	Production, Transportation Equipment (Billions of Fixed 2000 Dollars)
MC_REVIND(28)	Production, Measuring & Control Instruments (Billions of Fixed 2000 Dollars)
MC_REVIND(29)	Production, Miscellaneous Manufacturing (Billions of Fixed 2000 Dollars)
MC_REVIND(30)	Production, Crop Production (Billions of Fixed 2000 Dollars)
MC_REVIND(31)	Production, Other Agriculture, Forestry, Fishing & Hunting (Billions of Fixed 2000 Dollars)
MC_REVIND(32)	Production, Coal Mining (Billions of Fixed 2000 Dollars)
MC_REVIND(33)	Production, Oil & Gas Extraction & Support Activities (Billions of Fixed 2000 Dollars)
MC_REVIND(34)	Production, Other Mining & Quarrying (Billions of Fixed 2000 Dollars)
MC_REVIND(35)	Production, Construction (Billions of Fixed 2000 Dollars)
MC_REVIND(36)	Production, Sum of All Chemicals (Billions of Fixed 2000 Dollars)
MC_REVIND(37)	Production, Sum of All Petroleum Products (Billions of Fixed 2000 Dollars)
MC_REVIND(38)	Production, Sum of All Nonmetallic Mineral Products (Billions of Fixed 2000 Dollars)
MC_REVIND(39)	Production, Sum of All Primary Metals (Billions of Fixed 2000 Dollars)
(Aggregate)	Production, Total Manufacturing Output (Billions of Fixed 1996 Dollars)
(Aggregate)	Production, Total Industrial Output (Billions of Fixed 1996 Dollars)

Table B7. MC_EMPLOYMENT Output Variables

Employment Variable Name	Description
EMPIND1	Food Products, millions of employees
EMPIND2	Beverage and Tobacco Products, millions of employees
EMPIND3	Textile Mills & Textile Products, millions of employees
EMPIND4	Apparel, millions of employees
EMPIND5	Wood Products, millions of employees
EMPIND6	Furniture and Related Products, millions of employees
EMPIND7	Paper Products, millions of employees
EMPIND8	Printing, millions of employees
EMPIND9	Basic Inorganic Chemicals, millions of employees
EMPIND10	Basic Organic Chemicals, millions of employees
EMPIND11	Plastic and Synthetic Rubber Materials, millions of employees
EMPIND12	Agricultural Chemicals, millions of employees
EMPIND13	Other Chemical Products, millions of employees
EMPIND14	Petroleum Refineries, millions of employees
EMPIND15	Other Petroleum and Coal Products, millions of employees
EMPIND16	Plastics and Rubber Products, millions of employees
EMPIND17	Leather and Allied Products, millions of employees
EMPIND18	Glass & Glass Products, millions of employees
EMPIND19	Cement Manufacturing, millions of employees
EMPIND20	Other Nonmetallic Mineral Products, millions of employees
EMPIND21	Iron & Steel Mills, Ferroalloy & Steel Products, millions of employees
EMPIND22	Alumina & Aluminum Products, millions of employees
EMPIND23	Other Primary Metals, millions of employees
EMPIND24	Fabricated Metal Products, millions of employees
EMPIND25	Machinery, millions of employees
EMPIND26	Other Electronic & Electric Products, millions of employees
EMPIND27	Transportation Equipment, millions of employees
EMPIND28	Measuring & Control Instruments, millions of employees
EMPIND29	Miscellaneous Manufacturing, millions of employees
EMPIND30	Crop Production, millions of employees
EMPIND31	Other Agriculture, Forestry, Fishing & Hunting, millions of employees
EMPIND32	Coal Mining, millions of employees

Employment Variable Name	Description
EMPIND33	Oil & Gas Extraction & Support Activities, millions of employees
EMPIND34	Other Mining & Quarrying, millions of employees
EMPIND35	Construction, millions of employees
EMPSER1	Transportation & Warehousing, millions of employees
EMPSER2	Broadcasting & Telecommunications, millions of employees
EMPSER3	Electric Power Generation & Distribution, millions of employees
EMPSER4	Natural Gas Distribution, millions of employees
EMPSER5	Water, Sewage & Related System, millions of employees
EMPSER6	Wholesale Trade, millions of employees
EMPSER7	Retail Trade, millions of employees
EMPSER8	Finance & Insurance, Real Estate, millions of employees
EMPSER9	Other Services, millions of employees
EMPSER10	Public Administration, Federal Government, millions of employees
EMPSER11	Public Administration, State & Local Government, millions of employees
(Aggregate)	Total Manufacturing, millions of employees
(Aggregate)	Total Non-Manufacturing, millions of employees
(Aggregate)	Total Services, millions of employees
(Aggregate)	Total Nonfarm, millions of employees

Table B8. MC_VEHICLES Output Variables

MACOUT Common Block Name	Description
MC_VEHICLES(1)	Unit Sales of Class 1 Light Trucks, 0 to 6000 lbs., Wards Communication, Thousands of Vehicles
MC_VEHICLES(2)	Unit Sales of Class 2 Light Trucks, 6001 to 10,000 lbs., Wards Communication, Thousands of Vehicles
MC_VEHICLES(3)	Unit Sales of Class 2a Light Trucks, 6001 to 8,500 lbs., ORNL, Thousands of Vehicles
MC_VEHICLES(4)	Unit Sales of Class 2b Light Trucks, 8,500 to 10,000 lbs., ORNL, Thousands of Vehicles
MC_VEHICLES(5)	Unit Sales of Class 3 Light Trucks, 10,000 to 14,000 lbs., Wards Communication, Thousands of Vehicles
(Aggregate)	Unit Sales of Classes 1, 2 and 3 Light Trucks, 0 to 14,000 lbs., Sum, Thousands of Vehicles.

Table B9. MC_REGIONAL Output Variables

Regions:

Census Division	Description
NENG	New England
MATL	Middle Atlantic
ENC	East North Central
WNC	West North Central
SATL	South Atlantic
ESC	East South Central
WSC	West South Central
MTN	Mountain
PAC	Pacific
US	United States

Variables:

MACOUT Common Block Name	Description
MC_CPI	Consumer Price Index (All Urban) - All Items, 1982-84 = 1.0
MC_YPDR	Disposable Personal Income, billions of chained 2000$
MC_YPCOMPWSD	Wage & Salary Disbursements, billions of nominal $
MC_YP	Personal Income, billions of nominal $
MC_HUSMFG	Mobile Homes Shipments, millions of units
MC_HUSPS1	Single-Family Housing Starts, Private including Farm, millions of units
MC_HUSPS2A	Multi-Family Housing Starts, Private including Farm, millions of units
MC_KHUMFG	Stock of Mobile Homes, millions of units
MC_KHUPS1	Stock of Single-Family Housing, millions of units
MC_KHUPS2A	Stock of Multi-Family Housing, millions of units
MC_NP	Population Including Armed Forces Overseas, millions of persons
MC_NP16A	Population Aged 16 and Over, millions of persons
MC_RWM	Average Annual Manufacturing Wages, thousands of nominal $
MC_RWNM	Average Annual Non-Manufacturing Wages, thousands of nominal $
MC_COMMFLSP(2); AMUSE	Commercial Floorspace, Amusement, billion square feet
MC_COMMFLSP(3); AUTO	Commercial Floorspace, Automotive, billion square feet
MC_COMMFLSP(4); DORM	Commercial Floorspace, Dormitories, billion square feet
MC_COMMFLSP(5); EDUC	Commercial Floorspace, Education, billion square feet

MACOUT Common Block Name	Description
MC_COMMFLSP(6); HEALTH	Commercial Floorspace, Health, billion square feet
MC_COMMFLSP(7); HOTEL	Commercial Floorspace, Hotels and Motels, billion square feet
MC_COMMFLSP(8); MFG	Commercial Floorspace, Manufacturing billion square feet
MC_COMMFLSP(9); MISCNR	Commercial Floorspace, Miscellaneous Non-residential, billion square feet
MC_COMMFLSP(10); OFFICE	Commercial Floorspace, Offices, billion square feet
MC_COMMFLSP(11); PUB	Commercial Floorspace, Public Sector, billion square feet
MC_COMMFLSP(12); REL	Commercial Floorspace, Religious, billion square feet
MC_COMMFLSP(13); STORES	Commercial Floorspace, Stores and Restaurants, billion square feet
MC_COMMFLSP(14); WARE	Commercial Floorspace, Warehouses, billion square feet
MC_COMMFLSP(1); SUM	Total Commercial Floorspace, billion square feet
MC_EMPNA(1); EEA	Employment, Total Nonfarm (Millions of Persons)
MC_EMPNA(2); EMPIND35	Employment, Construction (Millions of Persons)
MC_EMPNA(3); EMPSER10	Employment, Federal Government (Millions of Persons)
MC_EMPNA(4); EMPSER8	Employment, Financial, Insurance, Real Estate (Millions of Persons)
MC_EMPNA(5); EMPIND32T34	Employment, Mining (Millions of Persons)
MC_EMPNA(6); EMPSER9	Employment, Other Services (Millions of Persons)
MC_EMPNA(7); EMPSER11	Employment, State & Local Government (Millions of Persons)
MC_EMPNA(8); EMPSER1T5	Employment, Transportation, Communications & Public Utilities (Millions of Persons)
MC_EMPNA(9); EMPSER7	Employment, Retail Trade (Millions of Persons)
MC_EMPNA(10); EMPSER6	Employment, Furniture and Related Products (Millions of Persons)
MC_EMPNA(11); EMPIND5	Employment, Wood Products (Millions of Persons)
MC_EMPNA(12); EMPIND6	Employment, Furniture and Related Products (Millions of Persons)
MC_EMPNA(13); EMPIND18T20	Employment, Nonmetallic Mineral Products (Millions of Persons)
MC_EMPNA(14); EMPIND21T23	Employment, Primary Metal Industries (Millions of Persons)
MC_EMPNA(15); EMPIND24	Employment, Fabricated Metal Products (Millions of Persons)
MC_EMPNA(16); EMPIND25	Employment, Machinery (Millions of Persons)
MC_EMPNA(17); EMPIND26	Employment, Other Electronic and Electric Products (Millions of Persons)
MC_EMPNA(18); EMPIND27	Employment, Transportation Equipment (Millions of Persons)
MC_EMPNA(19); EMPIND28	Employment, Measuring & Control Instruments (Millions of Persons)
MC_EMPNA(20); EMPIND29	Employment, Miscellaneous Manufacturing (Millions of Persons)

Appendix C: Equations in Regional Sub-module

Regional Macroeconomic Model

Endogenous Variables:

CPI_{R}	Consumer Price Index, all urban, 1982-84=1.0, regional
GDPRZNP	Real Gross Domestic Product, billions of 2000 dollars, national
GSPR_{R}	Real Gross State Product, billions of 2000 dollars, regional
GSPRZNP_{R}	Real Per Capita Gross State Product, billions of 2000 dollars per person, regional
RWM_{R}	Average Annual Manufacturing Wages, thousands of dollars, regional
RWNM_{R}	Average Annual Non-Manufacturing Wages, thousands of dollars, regional
TAX	Personal Income Tax, billions of dollars, national
TAXRATE	Personal Income Tax Rate, percent, national
YP_{R}	Personal Income, billions of dollars, regional
YPCOMPWSD_{R}	Wage and Salary Disbursements, billions of dollars, regional
YPCOMPWSDG_{R}	Wage and Salary Disbursements by Government, billions of dollars, regional
YPCOMPWSDP_{R}	Wage and Salary Disbursements by Private Sector, billions of dollars, regional
YPD_{R}	Personal Disposable Income, billions of dollars, regional
YPDR_{R}	Real Personal Disposable Income, billions of 2000 dollars, regional
YPDRZNP_{R}	Real Per Capita Personal Disposable Income, billions of 2000 dollars, regional
YPOTH_{R}	Other Personal Income, billions of dollars, regional

Model description is in Chapter 7. Codes and descriptions of the regions are in Table B9.

Exogenous Variables:

CPI	Consumer Price Index, all urban, 1982-84=1.0, national
CPIZ_{R}	Regional Consumer Price Index Relative to National, 2006:3 value, regional
GDPR	Real Gross Domestic Product, billions of 2000 dollars, national
JECIWSP	Employment Cost Index, private-sector wages and salaries, Dec. 2005 = 1.0, national
JPC	Consumption Deflator, index – 2000=100, national
JPC_REL_{R}	Regional Consumption Deflator Relative to National, 2006:3 value, regional
MHRSNFP	Manhours in Private Nonfarm establishments, billions of hours, national
NP	Population, millions, national
NP_{R}	Population, millions, regional

Exogenous Variables continued:

TAXRATE_REL_{R}	Regional Personal Income Tax Rate Relative to National, 2006:3 value, regional
YP	Personal Income, billions of dollars, national
YPCOMPWSD	Wage and Salary Disbursements, billions of dollars, national
YPCOMPWSDG	Wage and Salary Disbursements by Government, billions of dollars, national
YPD	Personal Disposable Income, billions of dollars, national
YPDR	Real Personal Disposable Income, billions of 2000 dollars, national
YPOTH	Other Personal Income, billions of dollars, national

Equations:

YPOTH_{R} = ((YPOTH_{R}(-1) / NP_{R}(-1)) * (YPOTH / NP) / (YPOTH(-1) / NP(-1))) * NP_{R}

Regional Commercial Floorspace Model

Endogenous Variables:

$Comflr_{ij}$ Commercial floorspace j, thousand square feet, Census Division i

The thirteen commercial floorspace types, j, are:

1. Stores - stores and restaurants
2. Warehouse - manufacturing and wholesale trade, public and federally-owned warehouses
3. Office - private, federal, and state and local offices
4. Automotive - auto service and parking garages
5. Manufacturing
6. Education - primary/secondary and higher education
7. Health - hospitals and nursing homes
8. Public - federal and state and local
9. Religious
10. Amusement
11. Miscellaneous, non-residential - transportation related and all other nec
12. Hotel - hotels and motels
13. Dormitories - educational and federally-owned (primarily military)

The nine Census Divisions, i, are:

1. New England
2. Middle Atlantic
3. South Atlantic
4. East North Central
5. East South Central
6. West North Central
7. West South Central
8. Mountain
9. Pacific

Model description is in Chapter 6.

Exogenous Variables:

COMFLR_FLW_TREND	Commercial floorspace additions trend, thousand square feet
COMFLR_STK_TREND	Commercial floorspace stock trend, thousand square feet
GDPR	Real gross domestic product, billions of chained 2000 dollars
CONSR	Real consumer spending on all goods and services, billions of chained 2000 dollars
NP	Total population including armed forces overseas, millions of persons
IFNRESML	Private investment in commercial buildings, billions of dollars

JPIFNRESC	Chained price index – nonresidential construction – commercial and health care, 2000 = 1.00
IIR	Real change in stock of business inventories, billions of chained 2000 dollars
EEA	employment – total nonfarm payrolls, millions of persons
RMCORPAAA	Yield on Aaa-rated corporate bonds, percent

Regional Industry and Employment Model

Regional Industry Output

Endogenous Variables:

REV{I}_{R} Output in billions of real 2000 dollars for sector I, region R (e.g. REVIND1_ENC)
XREV{I}_{R} Output in billions of real 2000 dollars for sector I, region R, equation estimate (e.g. XREVIND1_ENC)

Codes and descriptions of the sectors are presented in Table A14. Codes and descriptions of the regions are in Table B6.

Exogenous Variables:

CPI_{R}	Consumer Price Index, All-Urban for region R
EEA	Employment – Total Nonfarm Payrolls
GSPR_{R}	Gross State Product in billions of real 2000 dollars for region R
JPGDP	Chain Price Index – Gross Domestic Product
NP_{R}	Population in million for region R
RMPRIME	Prime rate at commercial banks in percent per annum
RWM_{R}	Annual Wage for manufacturing sectors in dollars for region R
RWNM_{R}	Annual Wage for nonmanufacturing/services sectors in dollars for region R
WPI05	Producer Price Index – fuel and power
@TREND	Time Trend

Equations:

Alignment process:

The alignment process takes the regional output shares of sector I computed from the equations and applied them onto the national output of sector I. This ensures that the sum of the nine regions aligns to the national total.

REV{I}_{R} = (XREV{I}_{R} / XREV{I}_SUM) * REV{I}_SUM

where:
REV{I}_{R} = Output for sector I, region R
XREV{I}_{R} = Output for sector I, region R, equation estimate
XREV{I}_SUM = Sum of 9 regions' XREV{I}_{R}
REV{I}_SUM = Output for sector I (national)

Detailed structural equations for X{I}_{R}:

Regional Employment

Endogenous Variables:

EMP{I}_{R} Employment in millions for sector I, region R (e.g. EMPIND1_ENC)
XEMP{I}_{R} Employment in millions for sector I, region R, equation estimate (e.g. XEMPIND1_ENC)

Codes and descriptions of the sectors are presented in Table A14. Codes and descriptions of the regions are in Table B6.

Exogenous Variables:

GSPR_{R}	Gross State Product in billions of real 2000 dollars for region R
HPMD	Average weekly hours in durable manufacturing
HPMF	Average weekly hours in manufacturing
HPMN	Average weekly hours in nondurable manufacturing
HRNFPRI	Average workweek for nonfarm business
JPGDP	Chained price index – gross domestic product
JQPCMHMD	Output per hour in durable manufacturing
JQPCMHMN	Output per hour in nondurable manufacturing
JWSSNF	Total compensation in nonfarm business
REV{I}_{R}	Output in billions of real 2000 dollars for sector I, region R
RUC	Civilian unemployment rate
SP500	S&P 500 index of common stocks
UTLB00004	Factory operating rate
WPI01	Producer price index – farm products
WPI0574_(R)	Producer price index – residual petroleum fuels
WPI057_{R}	Producer price index – refined petroleum products
WPI05_{R}	Producer price index – fuels, related products and power
WPI06	Producer price index – chemicals and allied products
WPI09	Producer price index – pulp, paper and allied products
WPI11	Producer price index – machinery and equipment
WPI12	Producer price index – furniture and household durables
WPISOP3000	Producer price index – finished goods
@TREND	Time Trend

Equations:

Alignment process:

The alignment process takes the regional employment shares of sector I computed from the equations and applied them onto the national employment of sector I. This ensures that the sum of the nine regions aligns to the national total.

EMP{I}_{R} = (XEMP{I}_{R} / XEMP{I}_SUM) * EMP{I}_SUM

where:

EMP{I}_{R}	Employment for sector I, region R
XEMP{I}_{R}	Employment for sector I, region R, equation estimate
XEMP{I}_SUM	Sum of 9 regions' XEMP{I}_{R}
EMP{I}_SUM	Employment for sector I (national)

Detailed structural equations for XEMP{I}_{R}:

IND1 - Food Products
