This replication package includes three files.

"s.sav" is the data file, presented in SPSS format, which was downloaded from Qualtrics.
"RP replication.R" is the R script that, when executed, utilizes "s.sav" to reproduce all the results presented in both the main text and the appendices.
"PR log.html" is the log file generated by running the R script in RMarkdown. It includes the R codes, outputs printed in the R console, and R plots.

To reproduce the results, create a working directory and store both the data file and R script within that directory. Then use the `setwd()` function at the start of the file "RP replication.R" to set your working directory. Following this, you can execute the rest of the script. This process will generate figures in the PNG format and LaTeX tables in the R console.
