IAT CATEGORIES & STIMULI FOR STUDIES 1 & 2:

Design Note: Participants were randomly assigned to an Implicit Association Test (IAT), as follows: one of three in Study 1 (Preferences for freedom-security, liberal-conservative, or White faces-Black faces) or one of two in Study 2 (liberal-conservative identity or White-Arab Muslim names). The order of the stereotype-incongruent and stereotype-congruent blocks was randomized between participants. See the manuscript for details or contact the corresponding author.

NOTE: Facial stimuli for the Black-White IAT can be downloaded from:
