This replication package includes four files:

1. **"aca_bjps_codebook.xlsx"** – This is the codebook providing variable lists from the three original experiments, as well as survey items and value labels.
2. **"aca_bjps.RData"** – This data file contains data from the three original experiments and national survey data from the ANES and CCES.
3. **"aca_bjps.R"** – This R script, when executed, uses "aca_bjps.RData" to reproduce all results presented in the main text and appendices.
4. **"aca_bjps_markdown.html"** – This log file is generated by running the R script in RMarkdown and includes R code along with outputs printed in the R console.

To reproduce the results, create a working directory and store both the data file and R script within that directory. Use the `setwd()` function at the beginning of "aca_bjps.R" to set your working directory, then execute the rest of the script. This process will generate PNG or PDF format figures and LaTeX tables in the R console.
