The replication package contains the following files:

- bes_f2f_original_v3.0.dta – Stata file of British Election Study face-to-face survey
- 1.variable_creation.do – stata script formatting survey for analysis
- 2.analysis.do – stata script creating the appropriate tables and statistics used in the paper
- 3.bes_twitter_facebook.R – R script creating the figures used in this paper
- 4.unweighted analysis.do – stata script that replicates the analysis in 2.analysis.do without using survey weights.

**Replicating analysis**

To replicate the analysis in the paper first run the stata do file "1. variable_creation.do" in the main replication package directory which creates a formatted version of the BES face-to-face dataset. After this is run, the tables and point estimates in the paper can be created by running "2. analysis.do" from the main replication package directory and figures can be created by running "3. bes_twitter_facebook.R" from the main replication package directory. “4. unweighted analysis.do” will replicate the analysis without using survey weights.
