VEGETABLES - FRESH MARKET

ANNUAL SUMMARY

1966

Production of the 27 principal fresh market vegetables and melons in 1966 was 2 percent less than in 1965 but was 1 percent more than average, the Crop Reporting Board announced today. The 1966 production of 218 million hundredweight compares with 223 million hundredweight in 1965 and the average annual production of 217 million. Major contributors to the decline from a year earlier were onions, sweet corn, cantaloups, watermelons, honeydews, and snap beans. However, production was at record high levels in 1966 for artichokes, broccoli, carrots, escarole, and lettuce. The value of principal vegetable and melon crops totaled 1,160 million dollars, 11 percent more than a year earlier. The two leading crops in value were lettuce and tomatoes, with a combined total accounting for 35 percent of the U. S. total.

The 1966 strawberry crop, at 469 million pounds, was 1 percent more than the previous year but 9 percent less than average. Production for fresh market accounted for 56 percent of the 1966 strawberry crop and quantities used for processing 44 percent. Estimates for production of mint for oil, valued at 23.1 million dollars in 1966, are also included in this report.

For 1966, the five leading States in the production of fresh vegetables and melons were: California, Florida, Texas, Arizona, and New York. These States accounted for 62 percent of the average, 70 percent of the production, and 72 percent of the value of the vegetables and melons produced in the Nation.

LEADING FRESH MARKET VEGETABLE STATES IN 1966

Rank	Harvested Acreage		Production		Value	
	State	Percent of total	State	Percent of total	State	Percent of total
1	California	23.3	California	34.0	California	36.8
2	Florida	16.8	Florida	17.1	Florida	17.6
3	Texas	13.2	Texas	8.1	Texas	7.3
4	Arizona	4.9	Arizona	6.2	Arizona	5.9
5	New York	4.2	New York	4.7	New York	4.7

Estimates in this publication relate primarily to fresh market production. While estimates for many vegetable crops include only fresh market production, those for a few crops, such as broccoli, cauliflower, and carrots, include substantial quantities processed. For asparagus, and strawberries, which are perennial crops providing production for both fresh market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production.

In this publication, the volume of vegetables sold for fresh market use is valued at f.o.b. shipping point, except garlic, for which prices are reported annually on a field run basis at the packinghouse door. The volume sold for processing is valued at the processing plant door--i.e. "equivalent returns at packinghouse door." For vegetables sold both for fresh consumption and for processing, total value is the sum of the values for both types of use. Per unit value is the quotient derived by dividing total value by total quantity. "Per unit value" is not in general a "price" and is not generally used for parity purposes except where one or the other type of utilization is negligible.

(Continued on page 63.)

"Acreage for harvest" in this summary embraces total acreage available for harvest, including mature acreage abandoned or only partially harvested because of low prices, shortage of farm labor, and other economic factors. Planted acreage in this report includes in addition to acreage for harvest, acreage lost or abandoned due to natural causes and acreage abandoned prior to reaching maturity because of economic conditions. Acreage lost and replanted to the same crop early enough to be harvested in the season for which it was originally intended, is counted only once. Acreage lost and replanted to the same crop for harvest in a later season is considered to have been planted in both seasonal classifications but is included as acreage for harvest in the second season only. Acreage lost and replanted to another vegetable crop is included as planted acreage in estimates for both crops but as acreage harvested for the second crop only. Both planted and harvested acreage published for asparagus and strawberries include only bearing acreage and exclude non-bearing acreage planted for harvest in future marketing seasons. Value is for the crop year and does not correspond to calendar year income. All 5-year averages of State and group totals are simple averages of annual data.

This summary provides fresh market estimates for the 27 principal vegetables and melons grown commercially in the more important producing States. These estimates provide basic statistics on over 80 percent of the national output of all vegetables and melons grown for fresh market sale. It has not been possible to include all vegetables in all States in this program.

These data are based upon information secured from growers, shippers, processors, public agencies, and other sources.
