VEGETABLES -- FRESH MARKET

Total 1956 commercial production of the 28 principal fresh market vegetables and melons in the important producing States was 216,211,000 cwt.--an increase of 3 percent over 1955 and 9 percent above the 1949-1954 average. Sharp increases in production over last year were recorded for cabbage, onions, lettuce, carrots, celery, cauliflower, and broccoli, and these more than offset significant declines for watermelons, cantaloups, tomatoes, and snap beans. This year's production in each of the winter, spring, and fall seasons exceeded that for 1955. For these three seasons, higher production of several of the hardy-type crops more than offset lower production of some of the more tender vegetables. For summer vegetable and melon crops, good yields were not enough to compensate for reduced acreages and production was slightly less than last year. Strawberry production in 1956 exceeded 1955 by 24 percent.

This summary, issued by the Crop Reporting Board, provides estimates of acreage, production, and value for 28 major vegetable crops, as well as mint for oil and strawberries, and is based largely upon information furnished by State Agricultural statisticians. The estimates for 1955 and earlier years have been reviewed on the basis of data from the 1954 Census of Agriculture, and minor revisions have been made where necessary. A bulletin giving revised estimates for the individual years, 1949-55, will be issued at a later date. The 28 major crops covered in this report are those included in the Crop Reporting Board's regular program of monthly estimates and normally account for over 80 percent of the commercial production of all vegetable crops in all States.

The estimates in this publication relate primarily to fresh market production. While the estimates for many of the vegetable crops include only fresh market production, those for a few crops, such as broccoli and carrots, include substantial quantities processed. For asparagus and strawberries, which are perennial crops providing production for both fresh-market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production. "Acreage for harvest" in this summary embraces total acreage available for harvest, including mature acreage abandoned or only partially harvested because of low prices or other economic factors. "Value" is for the marketing season or crop year and does not correspond to calendar year income. Group and All States averages are simple averages of annual data.

UNITS FOR VEGETABLE ESTIMATES CHANGED

In this annual summary, as well as in all future releases, yield and production estimates for fresh market vegetables are on a weight basis. The unit used for vegetables and melons is the hundredweight and that for strawberries and mint for oil is pounds. This change from the variety of units formerly used has been discussed with industry representatives and other users of these statistics. Reasons for changing from the heterogenous units formerly used to a uniform weight basis include: (1) absence of uniformity in containers used for some vegetables, such as carrots and tomatoes, making it impossible to select a unit which can be understood in all producing sections; (2) changes in packing practices and varieties which have resulted in variations in weight of individual containers so that the accuracy of data on a crate or bushel basis has been affected; (3) evidence that measurement of production in terms of weight is becoming more general.
