Zambia Midline Codebook

Notes on the LEAP Zambia Midline and Endline datasets

These datasets were broken into four sections. These sections are were presented to the user based on whether the participant reported still using the method.

#Section 1: Experiences with method	Relevant if still_using=1 (participant is still using the method)
#Section 2: Contraceptive use dynamics	Relevant if still_using=1 (participant is still using the method)
#Section 3: Experiences with method	Relevant if still_using=0 (participant is not still using the method)
#Section 4: Contraceptive use dynamics	Relevant if still_using=0 (participant is not still using the method)

Note that Section 1 and Section 3 presented very similar questions, worded slightly differently for continuers and discontinuers. For example:

Verision presented to continuers:	101. Can you rate your overall experience with your ${method}?
Version presented to discontinuers:	301. Can you rate your overall experience while you were using the ${method}?

For analysis purposes, these variables were merged. In the codebook and dataset you will find just one variable that captures the results of the above two questions, and other questions that were duplicated across sections in the data collection form.

Further, some questions in section 4 were repeated to present slightly different wording to participants who had their method removed rather than those whose method had been expelled. For example:

Version presented to participants who voluntarily had their method removed:	416. Have you been using any other contraceptive method since you had your ${method} removed?
Version presented to participants whose method came out unvoluntarily:	422. Have you been using any other contraceptive method since your ${method} came out?

Again, for analysis purposes, these variables were merged. In the codebook and dataset you will find just one variable that captures the results of the above two questions, and other questions that were duplicated.

Some women reported durations of method use that were invalid/not possible (duration given was longer than the amont of time between the insertion date and the interview date). The invalid_duration variable indicates which women this applies to.

ID Number	Explanation
50	Reported invalid removal dates at 6 months and therefore, were censored at baseline
