Files

Code

The replication package contains two separate .Rmd files.

First, a file called 00_cleaning.Rmd: which involves cleaning and wrangling the data, constructs relevant variables, and then saves the cleaned csv file into the working directory.

Second, a file called 01_analysis.Rmd, which creates the figures presented in the main manuscript, as well as additional analyses that are reported in the Supplemental Information section. Tables and Figures are presented in the order in which they appear in the manuscript.

Make sure to specify the appropriate working directory for your machine

Make sure to run all the functions that create the figures and tables

Both files may be knitted as a pdf for ease of navigation and the knit pdfs are provided under the Code folder.

Data

The Data folder contains all raw datasets, as well as the cleaned version used for all analyses under Cleaning.

Figures

The Figures file contains the figures created by the analysis code. The code exports the figures to this folder.

Tables are given as the .tex output which we copied and pasted directly into our primary LaTex file. For ease of presentation, we occasionally modified the names of the variables (i.e. from treat_long_collapse_2 to Full Film or educ_dum to College) in some of the tables in the Supplemental Information section.
