README file for **Low-Quality Seeds, Labor Supply and Economic Returns: Experimental Evidence from Tanzania**

by Bulte, Di Falco, Kassie and Vollenweider

This document describes how to replicate the results in this paper. The zipped file contains the data sets to replicate the results showed in the tables 1 to 4 and table 5. STATA is used to implement the analysis. Data are in .dta format. The routines are presented in a do file. These are the steps that should be followed.

1) Download and open the data file entitled “data_TZ_RESTAT.dta"
2) Open the do file entitled “TZ_seed.do”
3) Run the do file until **table 4.** included.
4) Results reported in tables 1-4 should appear in the STATA output.
5) Run the do file from **table 5**
6) Download and open the data file entitled “purchase seeds.dta”
7) Results reported in table 5 should appear in the STATA output. Note that to generate the marginal effects reported in the paper in table 5 column (6), dprobit should be used.
