**Instructions to replicate all results from "The Effect of Maternal Labor Supply on Children: Evidence from Bunching" by Carolina Caetano, Gregorio Caetano, Eric Nielsen and Viviane Sanfelice**

1. Create a folder "pathname" of your choice

2. Extract "ReplicationMaterial" into that folder. In the folder you should see two folders: one called "Rawdata" with NLSY files and another called "Program" with a series of numbered .do files

3. Inside the folder "Program" you will find a folder called "ado files". Copy and paste all the files inside this folder into your Stata ado folder under the folder with letter "c" in your computer. For windows computers: open file explore and the Stata ado folder is often located at "C:\ado". For Mac computers, open Finder, press Cmd + Shift + G and type "~/Library/Application Support/Stata/ado/"

4. Open 000_Master.do and enter your local pathname in line 13 (global path = "pathname/ReplicationMaterial/")

5. Using Stata 17 or later, run 000_Master.do. All results of the paper will be done in about 23 hours of running this .do file. The bootstrap iterations for standard errors take some time

6. Output files will be located in three new folders inside "ReplicationMaterial": Table, Figure and Dataset
