January 2025

Replication Files:

The replication materials consist of 2 code files: ‘preprocessingscript_routestorepresentation_forpub.r’ and ‘analysisscript_routestorepresentation_forpub.r’. These are R scripts and contain all code for preprocessing and analysis of our manuscript.

The replication material consists of 2 datasets, 1 for each script, ‘wideconjointdata.csv’ for the preprocessing script and ‘longconjointdata.csv’ for the analysis script. Note that the preprocessing script does create the longconjointdata.csv

Replication instructions:

As illustrated in the scripts, the code was run on R version 4.1.1 (2021-08-10)

The paper uses the wideconjoint data set, which is based on an original dataset that we collected through Kantar Panels.

You will need to set an appropriate path in your own computer for each of the datasets when loading the data, using the setwd(“your file path here/Dataset.csv”) function in R, this is highlighten in the code. The code highlights all necessary packages and loads them, and should also install them if they are not installed, please install and load these packages manually if the code does not work. From this point on, the R code should run smoothly. The R scripts contain the necessary code to clean the data and run the analyses. Please email us if you have any questions.
