Jurisprudence implies creating the body and methods for interpreting the law, while studying the relationships between law and society, with the scope of predicting the effects of legal decisions. The relationships in today's society are the issue when confronted with the unstoppable pace of technology and the law seeking a precedent when one may not exist and so being dismissed, as the normal status quo in our Courts.
What that does to innovation and uniqueness of new products/services trying to receive approval and a fair chance(not to forget it came out of a need and is the solution to a need)? What is the cost of innovation in the time of AI and ML (very highly and abstract fields of expertise) and why investment is not directly linked to those opportunities?
Presently, it is not and in my opinion as a scholar in the field is the major issue for any further innovation to reach success. This disconnect between financial(funding) and innovation is the first thing in my opinion that screams for conversation at USPTO level of authority and future guidance.
