Instructions for replication

"Childhood Exposure to Co-Ethnics Increases Naturalization"

The analyses in the article are based on data from administrative registers on the Danish population provided by Statistics Denmark. The analyses have been conducted on servers hosted by Statistics Denmark. The main analyses are conducted on the FSE Windows server, project number 702992. The analyses on the relationship between the ethnic composition and national identification (see S11 and Fig. S25 in the *SI*) are conducted on the FSE Windows server, project number 707835. All calculations were carried out with the software Stata MP version 18.0.

Given that these data contain personal identifiers and sensitive information of citizens, they are confidential and data cannot be made publicly available. However, researchers can apply to Statistics Denmark for access. In order to get access to micro data through Statistics Denmark, it is a prerequisite that the researcher is affiliated with a research environment pre-approved by Statistics Denmark. Statistics Denmark will not grant authorization to single persons. If not already affiliated with a pre-approved research environment, please contact the author for any help to become affiliated. To begin the procedure, the Research Unit at Statistics Denmark should be contacted by phone +45 3917 3130 or by e-mail forskningsservice@dst.dk.

Once access is granted to the data in project 702992, the replication file can be found here: "E:\workdata\702992\702992\Mathias Kruse\Diversity – Childhood_Adulthood\Immigrant integration\pnas_replication_files". This do-file is also available in the Dataverse. The do-file will load the dataset and reproduce all results presented in the article.

For more information about how to get access to Statistic Denmark's registers including information on the legislation, see the website: www.dst.dk/en/TilSalg/Forskningsservice (accessed October 22, 2024).
