USER GUIDE

This document is a guide and codebook for the American National Election Studies (ANES) 2020 Time Series Study, to accompany the full release of its pre- and post-election data.

The ANES 2020 Time Series Study is a continuation of the series of election studies conducted since 1948 to support analysis of public opinion and voting behavior in U.S. presidential elections. This year's study features re-interviews with 2016 ANES respondents, a freshly drawn cross-sectional sample, and post-election surveys with respondents from the General Social Survey (GSS). All respondents were assigned to interview by one of three mode groups—by web, video, or telephone. The study has a total of 8,280 pre-election interviews and 7,449 post-election re-interviews.

Current Release

This is a full release of this dataset and the third release overall. The previous two releases were preliminary, and did not contain some of the variables, processing, cleaning, and documentation that are a part of this current release. In particular, this release includes the following additions or changes to the data file:

Weights: The survey weights have been updated since the last preliminary release and are considered final weights. The new weights reduce the error in survey estimates of the presidential election outcome and allow design-consistent estimates of smaller subgroups.

Summary Variables: Additional summary variables have been added. Summary variables have the suffix 'x' at the end of each variable name.

Upcodes: The open-ended options that were a part of some variables, for example “Other: specify” categories, have been coded.

Corrections: Corrections to age, gender, other variables, or a combination of these were made after reviewing respondent comments that reported a data entry error or after staff review identified inconsistencies and we followed up with respondents to confirm the correct information. Such corrections were made to 216 cases identified in V200009.

Removed data: Post-election interview data were removed for four cases because a review indicated that the post-election respondent was not the selected person and was not the same person who completed the pre-election interview. The pre-election data were not affected. The cases IDs (V200001) where all post-election data were removed are 333168, 350453, 347372, and 414401.

As a result of these and other updates, users are recommended to check their preliminary release results against this current release, to assess whether the changes have any effect on their analyses.

Although GSS data were collected alongside the ANES post-election survey, they are not part of this release and will instead be released at a later date.

We would appreciate being notified of any errors in the dataset or documentation by email to: anes@electionstudies.org

Acknowledgments

The study was designed, and data collection supervised, by the ANES Principal Investigators and staff with design input from the ANES Advisory Board and also the ANES user community at large.

Ted Brader (University of Michigan) and Shanto Iyengar (Stanford University) were the Principal Investigators on the study.

Associate Principal Investigators were D. Sunshine Hillygus (Duke University), Daron Shaw (The University of Texas at Austin), and Nicholas Valentino (University of Michigan).

Matthew DeBell was Co-Investigator and Director of Stanford University Operations and David Howell was Director of University of Michigan Operations.

ANES staff on the project were Lindsay Dun, Lauren Guggenheim, Sang-Jung Han, Pat Luevano, Natalya Maisel, Laurie Pierson, and Jaime Ventura.

Data collection was performed by Westat, Inc. Westat developed the sampling plan and video interviewing system and collaborated with ANES personnel on other aspects of the study’s technical design. Lead personnel on the project at Westat

included Michelle Amsbary, Mike Brick, Rick Dulaney, Brad Edwards, Cindy Good, Justin Kamens, Drew Kistler, Shelley Roth, and Siu Wan.

The sampling frame was provided by Marketing Systems Group.

Sample Design and Respondent Recruitment

The 2020 ANES survey used a contactless, mixed-mode design that was created in response to challenges related to the COVID-19 pandemic. The pandemic made face-to-face interviewing unfeasible in 2020, and no in-person interviewing was done. Instead, a sequential mixed-mode design was implemented that included self-administered online surveys, live video interviews conducted online, and telephone interviews.

Sample Design

The 2020 ANES sample consists of several groups, summarized in Table 1 below[1].

The 2016 ANES group consisted of respondents who had participated in the ANES 2016 Time Series Study. The remaining sample was based on a freshly drawn cross-section, and addresses were randomly assigned to one of three sample groups where the groups correspond to a survey mode sequence. The target population for the fresh cross-section was the 231 million non-institutional U.S. citizens aged 18 or older living in the 50 US states or the District of Columbia. The sampling frame for the fresh cross-section was lists of residential addresses where

[1]The post-election survey also included respondents from the General Social Survey, details of which will be provided in a future data product.

mail is delivered, and to be eligible to participate, a respondent had to reside at the sampled address and be a U.S. citizen age 18 or older at the time of recruitment.

Residential addresses in the fresh cross-sectional group received mail invitations. The 2016 ANES respondents were invited by email where possible, with letters used if there was no email on file or after an initial non-response. Letters and emails pushed household members from the sampled addresses to respond to a screener on the web. Once a screener interview was completed, responding households followed different protocols for survey mode based on assignment to different sample groups. All respondents who completed the post-election survey did so in the same mode used for the pre-election survey.

The sections that follow describe the specifics of the sample groups for 2020.

Fresh Cross-Sectional Sample

The fresh cross-sectional sample was a random draw from the USPS computerized delivery sequence file (C-DSF), with all included residential addresses across the 50 states and Washington DC having equal probability of selection.

Addresses in the fresh cross-sectional sample were randomly assigned to one of three sequential mode conditions: web-only, mixed web, and mixed video.

Selected addresses were sent a series of letters to recruit one household member to go online to complete a survey. The invitation letter included $10 in cash and promised $40 for completing a survey online. Household members following the invitation link were taken to a screening instrument to randomly select one person from among the adult U.S. citizens living at the address to complete the ANES questionnaire. Upon completion of the screener, the selected respondent was invited to complete the survey based upon the mode of their assigned group. All web-only respondents completed the survey online. Mixed web respondents were offered web, and non-respondents and refusals received offers to complete the survey by phone. Mixed video respondents were offered live video interviewing via Zoom; non-respondents were offered web and later, phone. Among all groups of the fresh cross-sectional sample, non-responding households were offered escalated incentives of $100 later in the field period.

Web-Only (Web). Cases assigned to the web-only group were released in two replicates for the pre-election survey. Forty percent of cases were assigned to the first replicate, which was released at the beginning of the field period in conjunction with the other sample groups that received the pre-election study. The remaining 60% were assigned to the second replicate which was released partway through the field period, after the Republican and Democratic conventions. Releasing the sample in two replicates served two purposes. The timing of the first replicate release maximized the time available for data collection and comparability to other sample groups in 2020 while the second replicate’s field period roughly corresponds to the field period of previous ANES Time Series studies, which typically began after the conventions.

Respondents in both replicates completed both the pre- and post-election surveys online. The post-election field period was the same for both replicates.

Mixed Web (Web + Phone). Respondents in the mixed web group completed surveys online. Non-responding cases and refusals were shifted to the telephone, and the timing of this shift was at the case-level in the final weeks of the pre-election period. Respondents completed the post-election survey in the same mode as the pre-election survey. In addition to the incentives described above, some respondents in this group were offered $200 as part of a targeted, adaptive design approach; in the last two weeks of the pre-election field period, participants in under-represented groups (with a low response rate) were offered $200 to complete the questionnaire.

Mixed Video (Video + Web + Phone). Respondents in the mixed video group were invited to complete the survey by live video interview upon completion of the web screener. Following the invitation link, respondents were invited to wait briefly to connect with an interviewer and complete the study via Zoom or set an appointment. Respondents were shifted to web if they declined the video invitation or if they failed to respond to the invitation after several attempts. Later, non-respondents to web were subsequently pushed to phone. The timing of this shift was at the case-level in the final weeks of the pre-election period. In addition to the incentives described above, $200 escalations were offered for respondents to complete interviews by video to counter initial non-response. Respondents completed the post-election survey in the same mode as the pre-election survey.

Respondents from Previous Studies and Opportunities to Link Datasets

ANES 2016 sample. This sample consists of the full set of sample members from the ANES 2016 Time Series Study who completed the post-election interview in either the web or the face-to-face mode. All respondents in this sample group completed the 2020 survey online. Invitations were made by e-mail and mail. Mail invitations included $10 in cash and all invitations promised $40 for completing a survey online. Non-respondents were offered escalated incentives of $100 later in the field period, and some respondents from groups with low re-interview rates were targeted with $200 offers in the final two weeks of the field period.

For the ANES 2016 participants in this study, data can be merged from the ANES 2016 Time Series Study using the 2016 case ID variable, V160001_orig, to join the datasets.

GSS sample. This sample was run in the post-election study only and consisted of respondents who have previously participated in the General Social Survey. The current release of the dataset does not include GSS participants. Data from GSS participants, and more information about the GSS sample's participation in this study and about linking the ANES and GSS datasets will be provided in a future release of the data.

Data Collection

Field Dates. The study interviewed respondents in a pre-election survey that was conducted between August 18, 2020 and November 3, 2020. Election day was November 3, 2020. The study re-interviewed as many as possible of the same respondents in a post-election survey that was conducted between November 8, 2020 and January 4, 2021.

An exception to the aforementioned field dates was for the web-only sample group (see the Sample Design section for a description of this group), which was fielded in two replicates. The first replicate for this group followed the field dates described above. However, the first interviews for the second replicate instead began on September 11, 2020 and ended at the same time as the other sample groups. The post-election interviews for the second replicate took place at the same time as the other sample groups.

Locations. For video or web modes, the survey could be completed anywhere the respondent had access to the Internet on a computer or other device (including mobile devices). Likewise, phone surveys could be completed on any device with phone service.

Administration. Phone and video interviews were conducted by trained interviewers using interviewing software on computers.

For the telephone interviews, interviewers logged into a web questionnaire based on the one that respondents used when they completed the self-administered web questionnaire. In the telephone interviews, interviewers read these questions aloud to the respondents.

For the live video interviews, interviewers used a different version of the computer-aided interviewing software. Interviewers also had a window open with a Zoom (video communication software) connection to respondents. Interviewers could share a window with the respondent booklet via Zoom so that respondents, for select questions, could see pages of a Respondent Booklet that included response categories for the question.

Unlike in earlier years, the 2020 ANES did not use self-interviewing (CASI) during any part of the interviewer-administered modes (video and phone). Rather, in interviewer-administered modes, all questions were read out loud to respondents, and respondents answered orally.

Languages. Interviews in all modes were able to be conducted in English or Spanish.

Interview Length. The median pre-election interview length was 71 minutes, which includes a median of 69 minutes in the online mode and 93 minutes in the video

mode. The median post-election interview length was 78 minutes, which includes a median of 76 minutes in the online mode and 98 minutes in the video mode.

Response Rates

The response rate, using the American Association for Public Opinion Research (AAPOR) formula for the minimum response rate (known as AAPOR Response Rate 1) on the pre-election interview, was 36.7 percent overall for the fresh cross-sectional component of the sample (the web-only, mixed web, and mixed video combined). The minimum response rates for the three components individually were 37.8 percent for web-only, 39.7 percent for mixed web, and 27.6 percent for mixed video.

The estimated overall response rates based on the observed rate of eligibility (known as AAPOR Response Rate 3) on the pre-election interview were 42.1 percent for the web-only sample group, 44.2 percent for the mixed web group, 31.0 percent for the mixed video group, and 40.9 percent overall for the fresh cross-sectional component. Table 2 below shows the AAPOR Response Rates 1 and 3 and the post-election re-interview rates for the fresh cross-sectional sample groups.

Table 2. Response and Re-interview Rates for the Fresh Cross-Section

	Pre-Election			Post-Election	
	N	RR1 (%)	RR3 (%)	N	Re-Int. (%)
Fresh Cross-Sectional Sample	**5,441**	**36.7**	**40.9**	**4,783**	**87.9**
Web-only (Web)	2,283	37.8	42.1	2,012	88.1
Mixed Web (Web + Phone)	2,407	39.7	44.2	2,136	88.7
Mixed Video (Video+Web+Phone)	751	27.6	31.0	635	84.6

Notes. Response rates are based on AAPOR Response Rates 1 and 3. Re-interview rates are the percentage of respondents from the pre-election that completed the post-election study. “Sufficient partials” are included. Rates are not weighted.

The pre-election re-interview rate for the 2016-2020 panel cases was 77.9 percent.

Pre-election interviews were considered sufficiently complete to be counted as completions for weighting and for calculation of the response rate when the survey was administered through item SELFGEND_GENDTYP. The estimated AAPOR Response Rate 1 for the pre-election interview without the sufficient partial interviews was 37.1 percent for web-only, 39.0 percent for mixed web, 27.3 percent for mixed video, and 36.1 percent overall for the fresh cross-sectional component.

Post-election re-interviews were completed with 90.0 percent of pre-election participants overall. These re-interview rates were 94.0 percent for the ANES 2016

sample group, 88.1 for the web-only group, 88.7 for the mixed web group, 84.6 for the mixed video group, and 87.9 overall for the fresh cross-sectional component.

Restricted Data Access

Some variables have been removed from the full release dataset in order to protect respondent confidentiality. For these variables, the word “RESTRICTED” appears at the beginning of the variable label and responses have been set to the value “-3. Restricted.”

Examples of restricted variables include, but are not limited to: detailed geography, detailed religious denomination, birth date, detailed education, detailed business/industry, detailed occupation, detailed race/ethnicity, nationality, and detailed income.

Users can apply for access to some restricted variables through a Restricted Data Access agreement. Please see the Data Center on the ANES website for more information about the application process and variable availability.

Non-confidential, redacted texts for open-ended variables are available for download as an auxiliary file from the ANES 2020 Time Series Study page on the ANES website.

Data Analysis, Weights, and Variance Estimation

The data should be analyzed using weights to accurately represent the population. Sampling errors should be calculated using methods that account for the complex sample design and the effects of weighting on variance.

Weights

The full release of the dataset includes 14 post-stratified weight variables. These weights replace the weights that were included in the preliminary releases of the dataset. Compared to the preliminary weights on the previous datasets, the final weights on the current dataset reduce the error in estimates of the presidential election outcome and better facilitate design-consistent estimates of relatively small population subgroups. Each weight variable is designed for analysis of a particular subset or combination of sample cases.

For analysis of the complete set of cases using pre-election data only, including all cases and representative of the 2020 electorate, use the full sample pre-election weight, **V200010a**. For analysis including post-election data for the complete set of participants (i.e., analysis of post-election data only or a combination of pre- and post-election data), use the full sample post-election weight, **V200010b**. Additional weights are provided for analysis of subsets of the data, as follows.

V200010a	Full sample pre-election weight. This weight is for the full pre-election dataset, consisting of the combination of sample groups for the web-only, mixed web, and mixed video modes, and the 2016-2020 panel cases combined. Most analyses limited to pre-election data should use this weight unless the sample group is intended to be limited to a subset.
V200010b	Full sample post-election weight. This is the post-election version of the full sample weight, V200010a, to be used if any post-election data are included in the analysis of full-sample data.
V200011a	2016-2020 panel pre-election weight. This weight is for analysis of the 2016-2020 panel cases (also labeled as sample type 2 in V200003). Analyses should use this weight if the 2020 and 2016 data are merged and variables from the 2016 study are included in the analysis, and the population of interest is the 2016 electorate, and only pre-election data are used.
V200011b	2016-2020 panel post-election weight. This is the post-election version of the 2016-2020 panel weight.
V200012a	Web-only sample pre-election weight. This weight is for analysis of the web-only sample group alone (the sample subset limited to a web questionnaire option, also known as sample group 3A).
V200012b	Web-only sample post-election weight.
V200013a	Mixed web sample pre-election weight. This weight is for analysis of the mixed web sample group alone (the sample subset that used sequential mixed-mode interviewing that included a telephone option toward the end of the field period, also known as sample group 3B).
V200013b	Mixed web sample post-election weight.
V200014a	Mixed video sample pre-election weight. This weight is for analysis of the mixed video sample group alone (the sample subset that used sequential mixed-mode interviewing that attempted a video interview but accepted a web questionnaire or telephone interview, also known as sample group 3C).
V200014b	Mixed video sample post-election weight.
V200015a	All fresh sample pre-election weight. This weight is for analysis of sample groups 3A, 3B, and 3C in combination, including all fresh cross-sectional sample from 2020 but excluding the 2016 panel cases.
V200015b	All fresh sample post-election weight.

V200016a	All sample excluding mixed video pre-election weight. This weight is for analysis of the web-only, mixed web, and 2016-2020 panel cases in combination (sample groups 2, 3A, and 3B), excluding the mixed video sample group (3C).
V200016b	All sample excluding mixed video post-election weight.

Sampling errors and significance testing

Statistical procedures for complex sample designs should be used to obtain appropriate estimates of sampling errors and indications of statistical significance. Statistical software such as Stata, R with a survey analysis package, or SPSS with the Complex Samples package can perform a Taylor Series calculation of sampling errors when provided with the appropriate (pseudo-)strata and (pseudo-)cluster (also known as PSU or variance unit) variables. In Stata, the command to set up this type of analysis is as follows:

```
svyset [pweight=WEIGHT], strata(STRATA) psu(CLUSTER)
```

In the code example above, WEIGHT would be replaced with the correct weight for the type of analysis being performed (as indicated in the previous section on weighting). STRATA and CLUSTER would be replaced with the corresponding variance stratum and variance unit (PSU/cluster) for the selected weight, as indicated below.

For weight	use variance unit/PSU/cluster	and use variance stratum
V200010a	V200010c	V200010d
V200010b	V200010c	V200010d
V200011a	V200011c	V200011d
V200011b	V200011c	V200011d
V200012a	V200012c	V200012d
V200012b	V200012c	V200012d
V200013a	V200013c	V200013d
V200013b	V200013c	V200013d
V200014a	V200014c	V200014d
V200014b	V200014c	V200014d

V200015a	V200015c	V200015d
V200015b	V200015c	V200015d
V200016a	V200016c	V200016d
V200016b	V200016c	V200016d

For example, the code to set up Stata for an analysis of the full sample including post-election data is as follows:

```
svyset [pweight=V200010b], strata(V200010d) psu(V200010c)
```

Note that the stratum and cluster variable names on this release are different than the variable names on the first preliminary release of pre-election data, but the names are identical to the second preliminary release of the pre- and post- election dataset.

Weighting methodology

The weights for fresh sample cases were calculated in the following steps:

1. *Base weights* were calculated as the reciprocal of selection probability for each address. Within each of the three sample groups (web-only, mixed web, or mixed video) the selection probabilities were the same.
2. An adjustment was made for *unknown address eligibility*.
3. A *screener nonresponse* adjustment was made, weighting by the inverse of base-weighted response rates within groups defined by Census region, Census division, dwelling type, and whether or not the address had a telephone number associated with it on the sampling frame.
4. An adjustment was made for *within-household sampling* based on the selected person's probability of selection within their household.
5. A *pre-election nonresponse* adjustment was made using two variables from the screener: gender and the number of eligible adults in the household.
6. *Pre-election raking* adjustments were made to make survey estimates match known population characteristics (for which the main source was the March 2020 Current Population Survey): age by gender, marital status by gender, race/ethnicity by educational attainment, race/ethnicity by Census region, nation of birth, home tenure by metropolitan status, population density, household income, and early voter status. Large weight values were trimmed.

7. *Post-election raking* adjustments were made using the same characteristics as the pre-election adjustment.
8. *Composite* adjustments were made for combinations of sample groups. These composites were raked using the dimensions listed above and also adjust for different design effects in different sample groups by weighting each sample group according to its effective (design-adjusted) sample size.

For re-interview cases from the ANES 2016 Time Series sample, weights were calculated in the following steps:

1. *Base weights* consisted of the final 2016 post-election survey weight.
2. A sample-based raking adjustment for pre-election *non-response* was applied to make the sample match the 2016 results for *gender* and for *2016 sample type* (face-to-face or Internet).
3. *Pre-election raking* adjustments were made using the same factors described above for the fresh sample cases, as well as sample-based raking for the 2016 presidential candidate vote choice.
4. *Post-election raking* adjustments were made using the same characteristics as the pre-election adjustments.
5. *Composite* adjustments were made, as described above for the fresh sample cases.

Complete documentation of the weight calculation methods will be included in the study's forthcoming methodology report. Additional variables including replicate weights and weights at calculation stages prior to final post-stratification will be included in a future data release.

Orientation to the Data and Documentation

Dataset

The *ANES 2020 Time Series Study Full Release* is being made available in multiple formats: SPSS (.sav), Stata (.dta), Comma Separated Values (.csv), and a fixed-width raw data file that can be read into SAS, SPSS, and Stata using syntax statements that have been provided.

Variables are stored using formats optimized for their data type. Missing data are coded as negative numbers, for instance "-8. Don't know".

When downloading the dataset, users should also download and make use of the two following pieces of documentation:

Questionnaire

The first piece of documentation is the Questionnaire, a document that provides information about each of the questions that were asked in the survey. The

questions in the Questionnaire are presented in the order they were asked. The Questionnaire includes the following information, where applicable, for each question: the section in which the question appears, question name, question wording, universe (where only a subset of respondents were to receive the question, which respondents those should be), response options, question logic, randomizations, display specifications, mode differences, and corresponding variables from the ANES 2020 Time Series Study Full Release dataset.

User Guide and Codebook

The second piece of documentation is this User Guide and Codebook. The remainder of this file, following this narrative section, consists of the codebook.

Whereas the Questionnaire provides information about questions that were asked in the survey, the Codebook provides information about variables that appear in the dataset.

Questions and variables do not always have a one-to-one relationship. For instance, multiple questions may be combined into a single summary variable. Or multiple variables may be derived from a single question. Furthermore, not all variables have associated questions - for example, administrative variables.

The Codebook includes the following information, where applicable, for each variable: the variable name (all variable names start with a “V”, and summary variables end with the suffix “x”), variable label (with “PRE:” indicating that it is from the pre-election study), question wording/variable meaning, response/code values and meanings, universe (where only a subset of respondents appear in a variable, which respondents those should be; note that universes are not included for most summary variables), associated survey question(s), information about whether randomization was used, interviewer instructions, and any other notes about the variable.

At the end of the Codebook is an appendix that consists of the exact programming code used to create some of the key summary variables in the dataset. Note that the programming code is from a variety of statistical packages, including SAS and SPSS, and that the programming code sometimes makes use of variables that may not appear within the current dataset. The programming code is not intended to be run “as is” on the current dataset, but rather to provide users insight into how the summary variables were created.

INTRO PRE-ELECTION POLITICAL FIGURE THERMOMETERS

I’d like to get your feelings toward some of our political leaders and other people who are in the news these days. I’ll read the name of a person and I’d like you to rate that person using something we call the feeling thermometer.
Ratings between 50 degrees and 100 degrees mean that you feel favorable and warm toward the person. Ratings between 0 degrees and 50 degrees mean that you don’t feel favorable toward the person and that you don’t care too much for that person. You would rate the person at the 50 degree mark if you don’t feel particularly warm or cold toward the person.
If we come to a person whose name you don’t recognize, you don’t

need to rate that person. Just tell me and we'll move on to the next one.

INTRO POST-ELECTION SURVEY

[IF SELF-ADMINISTERED] Welcome back to the American National Election Studies for the second of two surveys. As you may remember, this research study is sponsored by Stanford University and the University of Michigan. Your participation is voluntary and you may decline to answer any questions you do not want to answer. The survey usually takes about 70 minutes. Your answers will be combined with other participants' answers to make a data file that will be shared with other researchers and used for future research. Your individual privacy will be maintained in all published and written data from the study.
If you are not satisfied with how this study is being conducted, or if you have any concerns, complaints, or general questions about the research or your rights as a participant, please contact the Stanford Institutional Review Board (IRB) to speak to someone independent of the research team at 650-723-2480 or email IRB2-Manager@lists.stanford.edu. You can also write to the Stanford IRB, Stanford University, 1705 El Camino Real, Palo Alto, CA 94306.
Please click Next to continue.

[IF INTERVIEWER-ADMINISTERED] Welcome back to the American National Election Studies for the second of two surveys.
As you may remember, when we invited you to participate we sent a page called “Answers to Questions about the Study.” That explained this is a voluntary research study and the interview takes about an hour. If you did not see that “Answers to Questions” document, you can look at it now before we begin, or I can answer any questions now.

INTRO POST-ELECTION POLITICAL FIGURE THERMOMETERS

I’d like to get your feelings toward some of our politicalleaders and other people who are in the news these days.I’ll read the name of a person and I’d like you to rate thatperson using something we call the feeling thermometer.
Ratings between 50 degrees and 100 degrees mean that you feel favorable and warm toward the person. Ratings between 0 degrees and 50 degrees mean that you don’t feel favorable toward the person and that you don’t care too much for that person. You would rate the person at the 50 degree mark if you don’t feel particularly warm or cold toward the person.
If we come to a person whose name you don’t recognize, youdon’t need to rate that person. Just tell me and we’ll move on to the next one.

INTRO STEREOTYPE HARDWORKING

Now we have some questions about different groups in our society. We're going to describe a seven-point scale on which the characteristics of the people in a group can be rated. In the first

statement a score of ‘1’ means that you think almost all of the people in that group tend to be ‘hard-working.’ A score of ‘7’ means that you think most people in the group are ‘lazy.’ A score of ‘4’ means that you think that most people in the group are not closer to one end or the other, and of course, you may choose any number in between.

V202515 POST: STEREOTYPE: WHITES HARDWORKING

INTRO HEALTH INSURANCE ISSUE

There is much concern about the rapid rise in medical and hospital costs.
Some people feel there should be a government insurance plan which would cover all medical and hospital expenses for everyone. Suppose these people are at one end of a scale, at point 1.
Others feel that all medical expenses should be paid by individuals through private insurance plans like Blue Cross or other company paid plans. Suppose these people are at the other end, at point 7.
And, of course, some other people have opinions somewhere in between, at points 2, 3, 4, 5, or 6.
