Replication guide for "Who stays and who leaves? Immigration and the selection of natives across locations" by Ortega and Verdugo

To replicate the results of the paper, you should do in the following order:

- Create the shift-share data from the Census using all files reported in the Prog21_Census folder. The files should be run using the order indicated by the number in the tile
- Create the wage data from the DADS using file reported in the folder Prog21_DATA_AJUSTSA
- Each table can be replicated using the programs reported in ProgTables and AppendixTable
- For some robustness checks, the programs included in the folders ProgDepartment, 3yearsSample and 5yearsSample must also be executed. This is required only for estimates at the department level, and estimates using 3 and 5 years average
- Intermediate tables that are necessary to replicate the results are included except housing cost data created by Chapelle and Eyméoud (2018)
