read.me file for “Jihadist terrorist attacks and far right party preferences: An ‘unexpected event during survey design’ in four European countries”

Perspectives on Politics

Tim Vlandas and Daphne Halikiopoulou

Files:

- Data for the four country-waves of the European Social Survey dataset that were analysed for all results are in the file “replication_data_20.11.23.dta”.

- The code in Stata to replicate the results in the manuscript using this data is in the do file “replication_dofile_20.11.23.do”.

Please make sure to have installed the following before running the dofile:

- “ebalance” to implement entropy balancing. This command was used to create balanced samples with our binary treatment, i.e. the control group data was reweighted to match the covariate moments in the treatment group. Requires: Stata version 11.2. Distribution-Date: 20150130. Author: Jens Hainmueller, Department of Political Science, MIT; and Yiqing Xu.

- “outreg2” to arrange regression outputs into tables. Note that the functionality of outreg2 is based on the earlier package outreg, by John Luke Gallup. Requires: Stata version 7. Distribution-Date: 20140817. Author: Roy Wada.
