A total of **1,909** CRs were alive and eligible for endline data collection in 2022. During Phase 1, 15 attempts were made to find each household. These included phone calls and in person visits across all times of day and weekday/weekends. Table 1 summarizes the status for all CRs at the end of Phase 1, and which groups move on to Phase II tracking.

Table 1: Summary of Phase 1 and Phase I

	Number	%	Phase II
Surveyed	1,119	58.62%	Complete, no Phase II
Refused	69	3.61%	Complete, no Phase II
Deceased	3	0.16%	Complete, no Phase II
Moved	367	19.22%	Move to Phase II
Not Available, but in same location and should be available in future	93	4.87%	Move to Phase II
No information	258	13.52%	Move to Phase II

This bring a total of **718 CRs that move to Phase II**. We allocate these into a more detailed set of groups, and then take a random sample. The proportion sampled depends on the group chosen. Table 2 summarizes the sampling.

Table 2: Sampling

	Number	% sampled	Total Surveys	Notes
Moved Internationally	42	100%	42 phone	18 of these have phone numbers so we will actually only call 18
Not available, but in same location	93	100%	93 in person	Survey all; as do have good information on them.
Moved, and have information	260	50% field/50% phone	260 (130 phone/130 in person)	Will randomly sample 50% of these for a field visit and 50% for a phone visit.
Moved, no information	65	20%	13 in person	Randomly sample 13 here
No information	258	33%	86 in person	Randomly sample 86

This leaves us with a total of **172 phone surveys and 322 in person surveys**. In person surveys should only be converted to phone if it is impossible to survey them in person. These cases must be carefully documented.
