Replication Package Instructions

Information:
Stata version: 18.5 SE-Standard Edition
macOS: Sequoia 15.5 (16 GB RAM)
Required Stata packages: rwolf, coefplot, kict, reghdfe

Instructions
This replication package contains code (do-files) and data to reproduce the findings presented in the paper and online supplementary materials.

The do-files and data are organized in separate folders (one folder for each of the three studies). This structure is important to keep when running all code, as each do-file calls on specific data etc. in specific paths.

To reproduce all results, simply run the script "Master.do". Please be aware that some of the code takes quite a long time to run.

Make sure to specify the appropriate working directory for your machine in the Master.do.

Each study has its own folder, containing data and do-files for both main and supplementary analyses. To find code for a specific output, please go to the scripts in these folders.

All outputs are saved in a folder called "Output".

Note that tables 3 and 4 draw on different estimations and are created manually (i.e. are not exported to the Output folder).
