Article: *Generous to Workers ≠ Generous to All - Implications of European Unemployment Benefit Systems for the Social Protection of Immigrants*

The analyses for the article were performed using Stata 15. The replication files contain the code that was used to setup the main micro-level file (setup, pool), add information on the macro-level (control, generosity) and perform descriptive (descriptives.do), bivariate (bivariate.do) and multivariate (reg.do) regression analyses.

Micro-level data comes from the *European Statistics on Income and Living Conditions* (EU-SILC). All analyses were performed using the EU-SILC v2 2019. The files were prepared using the corresponding setup scripts available under: www.gesis.org/en/missy/materials/EU-SILC/setups. Macro-level data for benefit generosity was downloaded from the website of the *Comparative Welfare Entitlements Dataset* project: cwed2.org. Information on GDP growth comes from the National Accounts of the Organisation for Economic Co-operation and Development (OECD). Details of the dataset can be found under: oecd.org/sdd/na. The index for labour market mobility was taken from the website of the Migrant Integration Policy Index (MIPEX): www.mipex.eu.
